Hi Eamon,

Just a suggestion - why not state your website address
IN FULL in your newsgroup messages.

It is then only necessary for the reader to 'mouse click'
on the address rather than spend the next five minutes
changing over to 'Internet search' and having to enter the
full address himself, with the many possibilities of error
and eventually giving up the whole idea as a bad job.

For example, if you click on my full website address below
my signature you will be transfered there almost
immediately.

Then help yourself to some free technical radio software
progams. Been a long time since we had a very early
morning chat on 160m. I must confess I havn't tried just
lately.

2. FS: New Roller Inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-01 00:00:00 UTC
From: k9sqg@aol.com
Message-ID: <19990531202239.27349.00004604@ng66.aol.com>
Source record: 69746

Have for sale, three roller inductors. None have ever been in service and look brand new, the older "single" one is dusty but should clean up sparkling clean.

Have two of the following:
24 uh, 22 turn edgewound roller inductor. Has dual contact arrangement that eliminates electrical "skipping" during rotation prevelant with most single roller/contact inductors. Has a potentiometer gear driven for an electrical position indicator. Has an insulated switching mechanism that activates at about the mid inductance range. The inductor is rated at 20 Amps. The construction is similar to the 40 uh one on page 66 of Surplus Sales of Nebraska catalog (it sells for $245). This 24 uh inductor was selling for $219 each by Surplus Sales at the Dayton Hamvention this year. I am selling both as a pair for $175 total, shipped to your door, conus only.

Have one of the following:
29 turn edgewound roller inductor, dusty, but apparently never used. The coil itself is 3 1/2 inches in diameter with a length of 6 inches. It has dual rollers to eliminate "skipping" during rotation. This is every bit as beefy as the ones above. All insulating surfaces are ceramic. Has a ceramic insulated flex coupling. The ends are triangular shaped but the corners are rounded. Selling for $75, shipped to your door, conus only.

If you have a high power amplifier, tuner, or antenna project in mind, these inductors will do the trick.

Thanks for reading the ad.

73

Evan

I guess if you can put up with Wayne Green's trash, the magazine is not too bad. I got tired of him bragging about all his trips and how smart he was and canceled my subscription.

I fail to see how knowing Morse Code will help you learn how to operate
a radio. I do not know Morse Code and can operate a C.B. Radio, FRS
Radio, Shortwave Radio, Scanner Radio...

13. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7ivt03$qig@news.Hawaii.Edu>
Source record: 69757
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

Hi Peter,

Look into Murata and Toko. They have ceramic filters centered at 1575MHz for
GPS. They normally have a bandpass of 4MHz.
Hope this helps.

16. Tube type xmtr problem solved - Tnx

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-01 00:00:00 UTC
From: cartercook@aol.com
Message-ID: <19990601135048.22552.00006863@ng-cj1.aol.com>
Source record: 69760

A couple of weeks ago, I posted a query asking for troubleshooting ideas on a tube type xmtr I am building.Many of you responded and I am grateful for your suggestions. Thanks to a local ham who brought his scope over yesterday, the problem is solved.

My problem was lack of drive from the osc tube to the grid of the final.In both the the osc and final plate ckts - 6AG7 and 6DQ5, respectively- resides an rf choke, naturally. I even bought two new chokes to fit those spots. The chokes I used were encapsulated, about the size of a half watt resistor. The scope showed us that these modern, solid state-intended chokes were saturating under normal hollow state circuit conditions. I dug through my junk box and came up with a couple of no name, no indicated value, ancient "pie" wound rf chokes and subbed them into place. The transmitter immediately came to life.

Moral: use tube type parts on tube xmtrs whenever possible.

Special thanks to Jack, the local ham who brought his scope and elmered me through this troubleshooting issue.

Yeah, dat's me. Thanks. Whatever possessed them to use a
transformer, when it would be easier to just drive a headphone
directly at that voltage. Like, a 16 or 32 ohm headphone works just
fine with a 1 or 2 volt supply and a couple transistors for the totem
pole output stage. We're only dealing with a dozen milliwatts or so
of power here.

> Cape Town

Either that or the soil was acidic or alkaline. That might make
dissimilar metals behave like that.

One thing is for certain: The AC voltage were man-made. The
frequency was probably your local power line frequency. Or there
might be a slight chance that it was a transmission from one of those
navy ELF transmitters that are for submarines. They operate in the
sub 100 Hz frequencies.

Sorry I missed the original posting. Quite a few silicon transistors
are happy running with a Vce of 1 volt or even less, so you might not
need to use germanium for your application. Of course, you do need
enough voltage to turn the base-emitter junction on, so you wouldn't
be able to use silicon transistors with a supply voltage of less than
about 0.6 - 0.7 volts.

I have at least 20 ea. 22 volt 2.4 amp transformers in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 or 10/$30 plus UPS.
36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. Call (334)347-5281 day/eve/wknd.

Hi All, Have a very heavy duty DC filter choke for a choke input filter design for a big linear amp. Its 10 Hy. @ 1 amp for 3000-3400 volt range and also have the resonating cap to go with it. This unit is commercial grade. A similiar unit from Peter Dahl is $250.00 plus shipping......I sell choke and capacitor shipped to you CONUS for $165.00. Please e-mail direct...Thanks 73 LOU

Hi Reg, thanks for your suggestion. www.qsl.net/ei9gq works fine with my newsreader (Outlook Express.) I assumed that all other newsreaders worked the same way. I see from your message header that you are using MS Internet News. Does this program need to see 'http://www' to recognise a hyperlink ?

==========
I don't understand the technicalities, but I use Windows95
with Microsoft Internet Explorer-3, which is an extremely
common combination.

All I know is - when 'http://' is included in the website
address everything works first time just by clicking on it.
Otherwise it doesn't.

I am on 160m, but only occasionally, from the Black
Country, West Midlands, with a microphone in one hand and
a wine glass in the other, between 22.30 and 23.30.

Regards Ed, from Reg, G4FGQ

I am interested in the article about a 2 mt. receiver published on QST
Arrl magazine February
1999 issue.

Has anybody built and tested such receiver?
Can anybody be so kind to let me know how to get the issue or someway
the photocopies of the article?

Thanks in advance

> -art clemons-

I agree Art, AND:
We are not even talking yet about cost-effectiveness (or the lack thereof)! That alone should relegate the 'auto tuner' to being a non-choice, even without its performance disadvantages (rapid QSY but with poor efficiency and high cost does not a solution make, for me).

Advertising is contrived to sell things, not assist potential buyers in making an informed decision. To become informed requires technical homework that one has to do on his own initiative, from unbiased sources. This excludes advertising copy or 'user testimonials' from those who have already made their purchase, and therefore have a propensity to substantiate their own choice. It also, unfortunately, usually excludes 'product reviews' in magazines who also accept advertising from the manufacturer. Ad writers are banking that their target audience will not make the effort to be technically informed. It turns out to be a good bet, sad to say.
Does no one get buyer's remorse these days? Too bad; it is a great teacher.

Don, W6JL

>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>> <<<<<<<<<<<<<<<<<<<<<<<<<<<

Originally published in the 1985 ARRL Handbook, I did a 1296 MHz
interdigital filter made of commonly available material. It was in the
Handbook for nearly 10 years and was part of a 1296 to 10-meter
transverter. You could shorten the resonators a bit by the ratio of
1296 to 1500, or about 10%. If I remember, the filter had a 3 dB
bandwidth of about 15 MHz. The slightly higher frequency with the same
design (shortened by 10%) should give you just about what you want.

35. List Of Stamp Applications [990602]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-02 00:00:00 UTC
From: cjX@hth.com
Message-ID: <375540af.11393313@news.sverige.net>
Source record: 69685
Cross-posted to: comp.robotics.misc,comp.home.automation,sci.electronics.misc,rec.radio.amateur.homebrew

Hi,

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially Guy
Gustavson's story (see #001) about how he saved his beloved cat Kesha
gave me the inspiration to start writing L.O.S.A. I hope Kesha still
is alive and having a great life. Now 4 years later there are 150+
applications described and I hope you will enjoy reading all (or
parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 Why are some links dud's ?

Since people changes their e-mail and web addresses some links may be
dud's. If you previously contributed with one (or more) of the
applications please take a quick look and check your e-mail address

and/or web-links. I'm only able to keep the list updated if I'm
informed about changes, thanks in advance.

1.3 List of contributions

one possible solution is shown in UHF Unterlage I/II (DJ9HO): B.3.2
Einfaches VSWR-Ger�t mittels Koaxialkabel.
It is useful for 144-1296MHz, I use it for 2m

it was some interest for the book series, but I have only an old
address:
Fachbuchverlag WEINER
Vogelherder Str 32, D-8670 Hof/Saale
Teil V has the following ISBN 3-927528-05-6

Also be aware of new printed versions of bilingual (English/German)
DUBUS technik I/II books for VHF/UHF/SHF techniques - dated 1980 and
1985, they will appear later this year, but you should send a msg if
you are interested to have your copies.

41. Frequency Multipliers using PIN diodes as SRD's

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-02 00:00:00 UTC
From: rick@area.com
Message-ID: <7j4nsf$o4v$1@vax.area.com>
Source record: 69691

A few weeks ago there was some discussion about building comb generators
and frequency multipliers. At that time I stated that step recovery
diodes (SRD's) were difficult and expensive to get. However, I recently
learned that cheap and available PIN diodes can be used as SRD's.
This is described in Hewlett Packard Application Note 1054. It is
available at their web site at:

<<http://www.hp.com/HP-COMP/rf/app_index.html>>

Click on "AN-1054. Low [Cost] Frequency Multipliers Using Surface Mount PIN
Diodes". Note that due to a typo, the word "Cost" is missing from
the link.

Howdy....Attempting a repair on my Bird Hammate model 4360 (hf) wattmeter. The pickup has at least one burnt resistor....appears to be 35 ohms...wonder if anyone can confirm this (the remaining fragments are pretty small!). Of the remaining components part of the pickup assembly, there is a glass encased axial lead device which quickly looks like a diode but lifted shows no junction voltage/difference (short) either fwd or reverse....it is a little different looking than diodes I've seen and wonder if anyone can confirm that it (was) a diode or is something else (fuse maybe?). Daring to ask...does anyone have a schematic for this little wattmeter who could describe the components of the pickup (rotating directional coupler) assembly re values etc. Thanks - See if I can get my fleamarket "prize" working LOL.

Source record: 69695

It seems like the camels nose (or other end) is in the tent. This groups is not a sale group, although some have the opinion that they can post sale stuff anywhere they please, and others think that "precedent" means that once others post here that it is OK for all. Just a reminder - this is a group for discussion, not for selling. Rec.radio.swap is the group for selling radio related items.

Lets keep some sanity in the rec.radio groups lest they all become overrun like rec.radio.amateur.equipment has. Alternately I suppose we can look forward to 2,189,741 postings per week as pointers to ebay in every group in usenet.

- 73 Bob W7OV

The newsreader bundled with Wordperfect and Netscape v. 4 in the several-hundred-dollar Corel Suite 8 doesn't qualify as a "proper" newsreader by your standard. (I purchased Agent but found it to be too complex for my simple needs so don't use it.)

Communication of all kinds, including postings on the web, would be much more effective if written for the convenience and understanding of the reader rather than the convenience and ego of the writer.

To clarify: I guess what I was thinking is that I am assuming this is a 1/2 wavelength antenna (rough guess based on size) and that if I double the appropriate dimensions I could make it a full wavelength antenna with better performance. With this design I am confused as to what portions resonate on each band to check this with the appropriate calculations. The change to 1" tubing was only to give added rigidity to compensate for the extra length. By the way, I built it today (as in the plans) and it works great!! Now if I can just make it even better....

By doubling all your measurements you might have an antenna of the same gain but on half the freq. So if you started on 2 meters , your new antenna would probably work on 73 Mhz or so. If you are building a j pole, you can roughly double the gain by making a super j pole. This is done by adding a section to the long side through a matching coil which is often just a section of stiff copper wire bent back on itself and sort of circled around the pole. The short side would be 1/4 wave, the long side would be 3/4 wave, then the 1/4 wave matching circle, then a 5/8 wave section on top of that. The gain is reputedly 6 db but I doubt if its quite that high. You could also make a j beam for about 10 db gain. If you want more gain yet, you should be building a co linear type with stacked 5/8 wave sections.

>I guess what I was thinking is that I am assuming this is a
>1/2 wavelength antenna

I take that back. Perhaps it is active as a full wavelenth offset vertical dipole on 2M? 60.75" off the center conductor and 16.75" off the the shield for an approx wavelength of 77.5" which would be for 144.94mHz?? Also, if I am figuring this right then lowering the wire on the taller antena section should make it longer, and thus lower the resonating frequency? And it's resonating on 70cm because the 2m band is approx 3x the wavelength of the 70cm band? I should have started building antennas a long time ago-this is educational!!
Eric

Ok-I am determined to build rather than buy-recommended books or web
sites on this type of construction? Also, I gather from your post that
exceeding
1 wavelength does not produce any additional gain, but instead you use
mulitple
segments of a resonant length?
Thanks, Eric

At the same time, I don't think many of us are interested in digging through
2,000 "FS:YEASU(sic) FT-6000SUX ***RARE!!!***" posts on this newsgroup to
find a few discussions, either.

The newsgroup can survive quite nicely with the regulars occasionally
jumping in with extras or neat finds. But looking through here right now,
I see three for-sale posts from K9SQG; I don't recall him ever participating
in a discussion I've seen. If this is the homebrew newsgroup, then what
does this little K9SQG item:

> Do not need cabinet, just the insides from a large Johnson Matchbox.

have to do with it? If he wants to buy one, rec.radio.swap is the appropriate
place; if he wants to make one, this is, but he doesn't seem to want that.

Or "QRO KING", who appears to have a little business going making leenyars
and doesn't mind retailing parts on the side.

Most of the crap that's here is of that kind. People you *never* see here
participating in the newsgroup are using it as their own personal sales
tool. That dog don't hunt.

59. use 75 ohm attenuator for 50 ohm mesaurements

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-03 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <3757040C.3099FA27@lafn.org>
Source record: 69638

Hi,

I have an 80 db max switch selectable 75 ohm Heathkit attenuator unit
I plan to temporarily use for some 50 ohm measurements.

I am connecting 1 db T pads, 75 ohms in and 50 ohms out, to
the input and output ports of the 75 ohm unit.

My question is, when I set the 75 ohm unit to 3db, what is the overall
attenuation? DO the attenuations add? Do I have attenuation set by
switches plus IN and OUT pads attenuation?

I am not sure how to calculate the overall effective attenuation? Also
is it advisable to use larger attenuator T Pads at the input and output?

Is this use of T pads a workable scheme?
Alternate suggestions?

Seems I never truely finish a radio, they are "works in progress"....

Anyway, found I could get better conversion gain if instead of connection the second control grid (of a dual control pentode, 5636) to the cathode of the hartley style local oscillator triode, I connect to its grid instead. A significant increase in gain. But at the price of a tad bit of local oscillator pulling by strong stations at the top of the AM MW band.

See my updated web page on this at http://www.netcom.com/~wa2ise and click the link.

There are many web sites that list radio modes. A simple search should
give you a number of hits. Also try the Icom site. I think they post
modes for their radios.

72. Problems with 121MHz Crystal Oscillator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-03 00:00:00 UTC
From: vk3em@hotmail.COM
Message-ID: <19990603130203.2931.qmail@hotmail.com>
Source record: 69709

Hi People,

I've been tearing my hair out over a 121 MHz crystal
oscillator.
My original idea was to use this as the 1st LO for a 2m to HF
down converter (for a 23MHz to 25MHz IF) for a fox hunting
system. My previous attempt used a 40MHz crystal but I had
problems with the 80MHz harmonic mixing with local FM broadcast stations.

The problem with the 121MHz crystal oscillator is this.
It oscillates at 60.5 MHz! Now, 60.5 is exactly 1/2 of 121 Mhz,
but how can the crystal operate at this frequency? Surely a
121MHz crystal will be a 5th or 7th overtone? I know nothing
else about the crystal except that there is 121.000 stamped on
the case.

I've tried several different circuit configurations,
values, voltages and even a grounded base oscillator that
Ulrich Rohde suggested in his book on receievers (His values
were for 120MHz). I've simulated his circuit and found that
the free running osc frequency (no crystal) with his values
is 65 MHz. I've tried several different slug tuned coils
in the collector and still no go.

When the crystal does oscillate at 60.5MHz I do get 121 MHz as a
harmonic, but its about 20dB down on 60.5 MHz.

I've wasted a lot of time on this osc, so I will
probably go back to the 40 MHz and trippler with a
lot of filtering to notch 80MHz. I'd just like to know if
anyone else has seen this weird behaivour or am I not
understanding my crystal theory properly?

Anyone have any ideas on this?

Regards,
Luke

I have seen crystals for VHF equipment marked with the operating
frequency of the *equipment*, not that of the crystal. For example, a
crystal marked "146.7" which actually oscillates on 45.333mHz.
(multiply by 3, then add 10.7..) Is it possible this crystal was out of
an aircraft radio transmitter and is intended to double to 121mHz?

These things are more complex than you might think. (it's only mass production that gets the cost so low) I'm not sure I'd try to undertake one without considerable experience -- in any case, a homemade variety is likely to be illegal in many countries. (it certainly is here in the USA unless operated by licensed amateurs within amateur bands)

All that said.. I'd take a look at
http://www.intio.or.jp/jf10zl/
. It has a number of interesting circuits for simple low-powered transmitters and simple receivers.

I built one for 2m once upon a time (I think 1969) after a recipe of
Rothammel: Antennen (An east German author). It was a stacked
version with two planes. Though my technical possibilities were
very limited at that time I got it working reasonably well and
had som nice qsos up to 300 km in distance at good conditions.

If you can get along with my english I can translate for you
the crucial passages.

Ham spirit!

78. 75 ohm attenuator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-03 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <3756A5A7.D3967AB2@lafn.org>
Source record: 69715

I have a Heathkit 75 ohm switchable attenuator, up to 80db.
I want to use it in my 50 ohm applications until
I can buy a good 50 ohm unit.

I lost a reference to method where pads
can be placed at input and output of 75 ohm unit, to
allow use as a 50ohm unit. Using the pads allowed a rough esitmate of
the 50 ohm atteunation versus switch settings.

I believe the pads where 75 to 50 ohms pads.

Appreciate any hints with the math and needed pads.

Actually, home-built devices are specifically permitted under Part 15 of the FCC rules (section 15.23). The "builder is expected to employ good engineering practices to meet the specified technical standards to the greatest extent practicable." Like commercial Part 15 devices, they're subject to the non-interference provisions of the regulations (section 15.5).

A walkie-talkie which complies with the Part 15 technical standards referred to above would have a very limited range, nowhere near the range of an amateur or commercially-purchased "personal communication" unit.

Very much so. Their range is not extensive but convenient to access, if
you want the more exotic ones try BEC www.bec.co.uk who are their UK
importers and stock pretty much the entire range.

There was an article in "QST" several years ago about some
people who worked for Novatel in Canada who had come up with firmware
mods that allowed for operation in the 902 MHZ band. I don't remember
much as to what kind of operation was possible, but it had to be
pretty clever to get around the fact that cell phones operate full
duplex with a fixed separation of 45 MHZ which would complicate things
as the 902 MHZ band is only 26 MHZ wide. I think the mods made use of
the phone's data modem but I don't know what they were doing with it.

86. cheap HF radio idea

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-03 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7j6nhd$2ma$1@uranium.btinternet.com>
Source record: 69723

I have tried in the past to make various HF superhets, but have been unable to get good results due to problems getting the oscillator and aeriel tuned circuits aligned and tracking properly. I had the idea of making a receiver based around a crystal controlled converter, perhaps using one or two tuned RF stages, a mixer and crystal controlled local oscillator, followed by a band pass filter, which would develop a variable IF frequency which would then be fed to a long wave (140-400kHz) receiver. Therefore coverage of a particular HF band could be tuned over the long waveband. For example, a 6.86MHz crytal would give coverage from 7.000 to 7.260MHz. I would expect the stations to be well spread over the LW band since its range is only 260kHz wide. I assume that coverage would be too cramped if I used an IF which fell into the MW (540-1600kHz) band, with its 1060kHz width. Adding a BFO to the LW receiver would then be a simple task.
I would be interested to hear your comments on my idea. For example, will I get adequate sensitivity and selectivity?

Best wishes from John Cunningham.

87. Higher gain copper cactus???

Hi , I am building a dual-band copper cactus tonight:
http://www.geocities.com/Baja/4990/cjpole.htm
Thinking I could build a higher gain version for a base station
by using 1" copper tubing and approximately doubling all
measurements. Anyone ever try this?? Anyone think it will
work? Also, I know you are supposed to be able to adjust SWR
by moving the wire on the long extension, any procedures or
do you just wing it (I have a SWR meter to check)? If I don't get
any real negative feedback I may just try it an report the results.

> homebrew project. please email.

Yes, for example the Norcal 40, a wonderful rig, or his little Brother,
the SST. Both are from Wilderness Radio, constructed by WAyne Burdick,
N6KR. I've built the SST, his size is abt. 86mm x 95mm x 40mm, just a
backpacker rig, hi. Althoug, Wayne said, the Norcal 40 _is_ the better
radio.

Specs of the SST: 2W out, MDS -135 dBm, xtal filter bw abt 300 Hz (!),
current consumption abt 20 mA rx, 250 mA tx.

So i use a pack of 10 AA NiCd cells and have abt. 4 hours of fun.

cu, Ralf

Sorry, Bob, that prohibition is way too general to be reasonable. If an individual is looking to sell parts or test equipment whose attributes and prices make them especially useful for homebrewing, I want to see a notice here. I am not interested in digging through 2,000 "FS:YEASU(sic) FT-6000SUX ***RARE!!!***" posts on rec.radio.swap to see if someone is offering a few diodes or a used scope probe I'd be interested in.

Likewise I'll continue to post notices here on the rare occasions I'm looking to sell something that's likely to be useful to someone who builds stuff. If you really can't deal with that, set your newsreader filter accordingly.

OTOH, maybe you're referring to the latest trend of people posting ads for commercial factory-built ham gear and other off-topic items on the group. If so, I agree 100%. Let's all gang up and flame 'em to a crisp -- but preferably in email. Repeated abuses should be brought to the attention of the user's ISP as well.

>
> Lets keep some sanity in the rec.radio groups lest they all become overrun

>
> - 73 Bob W7OV

I would suggest that threads like this are themselves off-topic and destructive to the group. Go to dejanews and look at any group which has a large population of both ware-hawkers and netcops. (rec.antiques.radio+phono and rec.radio.amateur.boatanchors come to mind, in particular.) On these groups you will find that the number of posts from people bitching about FS: and FA: ads on the group invariably outnumbers -- often by an order of magnitude -- the FS: and FA: ads in question. As a threat to bandwidth on a newsgroup, it's hard to beat a FS:-vs-no-FS: flame war for sheer lack of content.

In your own case, a quick DejaNews search shows that you (bobh@proaxis.com) have made 6 posts to r.r.a.h. contributing useful information to the group, and 13 posts complaining about other people not contributing useful information to the group. Enough said (literally).

Unless the intent of a newsgroup's charter is in serious jeopardy, it is arguably best to say nothing at all, lest one contribute to the same deterioration of useful discourse one is complaining about. Taking my own advice, I'll now shut the hell up. :)

> Is it possible this crystal was out of
>an aircraft radio transmitter and is intended to double to 121mHz?

If the output on 60.5MHz is truly crystal-controled, then it's almost certainly marked as Doug suggests. Normal shear-mode crystals will only oscillate on odd-numbered multiples of the fundamental frequency - they can't oscillate at half-frequency or twice-frequency.

Most likely it's a 5th-overtone xtal with a fundamental on 12.1MHz, but it will only oscillate at 12.1, 36.3 (3rd overtone), 60.5 (5th), or 84.7 (7th). You'd have to try much harder to make it oscillate on higher overtones.

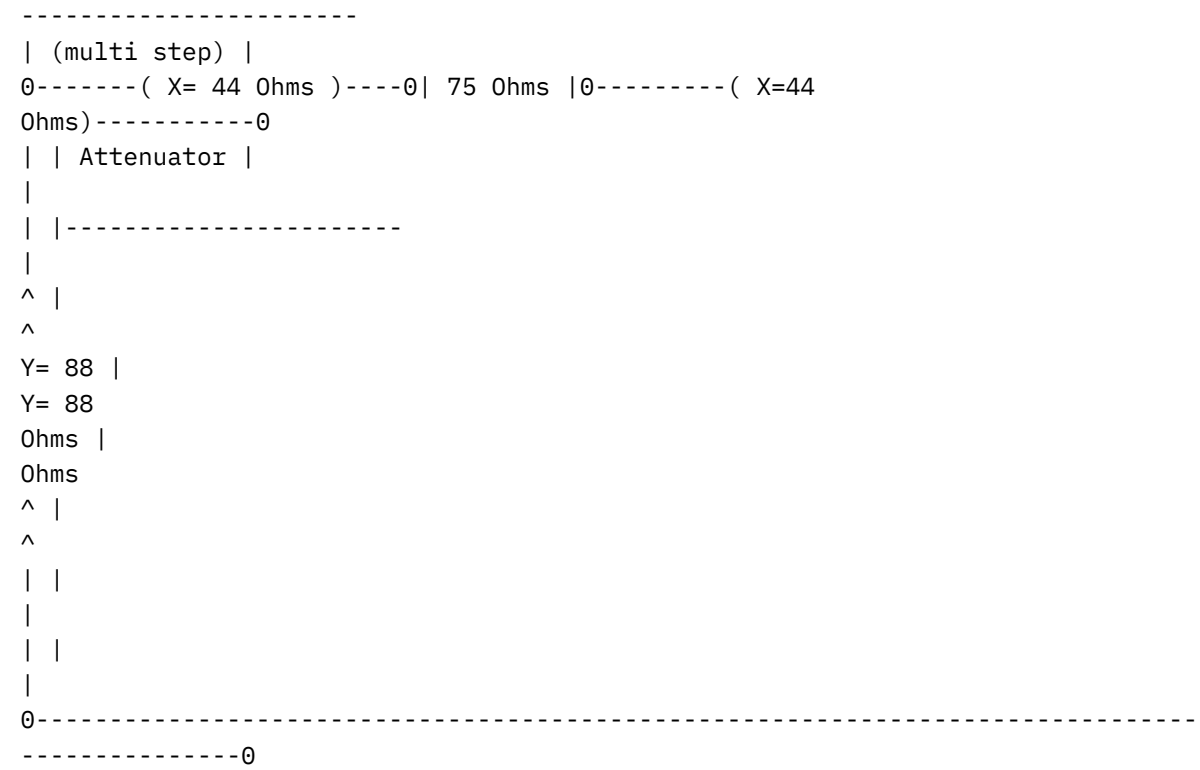
> Appreciate any hints with the math and needed pads.
> 73, W6MIK
==========
David , To make a 75 Ohms attenuator suitable for 50 Ohms in and out,
you add 44 Ohms in series with both the exisisting in- and output and
bypass the new (50 Ohms) in- and output with 88 Ohms.
However by doing so you add a fixed 12 dB attenuation.



Hope the above ASCI pic gets through OK

You can do the calculations with standard algebra , with the series
resistors each X and the bypass resistors each Y (Input and output

are obviously identical)
Just consider the input only
You now have 2 parallel resistors eg Y and (X+75) .
For 50 Ohms : 1/50 equals 1/ (x+75) + 1/y ----> this provides the
relationship between X and Y but this is moderately complex.
By making a table for different Y/X ratios X & Y can now be easily calculated
In the above example the ratio Y/X = 2 . Try other ratios and
check the resulting added attenuation.
You might get some odd resistor values.

If you have carbon composition resistors in the junkbox you could try
making the odd value resistors yourself.
Take a standard resistor with a value LOWER than the odd value you
need. If you now file or grind a bit off the side ,the resistance
increases (do this very carefully) Frequently test the resistance
with a suitable Ohm meter
When the wanted value has been reached the resistor can be coated
with a suitable varnish (eg polyurethane)
An advantage of carbon composition resistors is their low inductance.
This method is also suitable for making meter current shunts and
series resistors for re-ranging volt meters.

Perhaps you understand why I am a carbon resistor collector . At
Junk Sales and flea markets usually nobody wants them.
If they only knew ....

Good Luck

cut the lengths to be resonant on frequency, the droop wont change the
impedance that much, I think an inverted vee is still very close to 70
ohms. the pattern of the antenna will probably be a little less
directional than a horizontal dipole, height affecting it also. It will
probably work just great.
I have an inverted vee multiband and it works well on all bands, and on
10 meters, but I use a vertical dipole as it works better on 10 meters.
I have made the vertical dipole from copper pipe, and 11 meter quarter
waves back to back, cut to match, both work well.

Hi David

Using this IF (140 to 400KHz) you will need a good filter in the
front end in order to reject the band from 6460 to 6720KHz.
When the receiver is tuned to 7000KHz, if there is a station in 6720KHz
it will be heard too, unless the filter in the input makes it weaker
than the station you intend to hear.

Depending on the signal levels arriving in these two frequencies , even
the front filter will not suffice.
So, try to increase the IF. The front filter will be easier to

construct.

Good luck!

Bob - breaking out your old camel routines is going too far. As you know
a camel should never stick his butt in a tent - the last one who tried
that - is still running accross the desert with his backside in great
pain.

I think you owe some apologies,because I dont think anyone who has
posted a FS ad here in the past 3 months hasnt met you or been drawn
into dialogue with you. You must be tired of the free insults by now too
and I think you would like to end this. Instead ask the list owners
(charter group) to monitor the group if you beleive or are bothered
that FS of home brew items is not legitmate use of the newsgroup. I know
others do not share your views, and thier opinion should be weighed as
much as yours. I must say that any FS ads or WTB or FA(very few) have
been for decent home brew stuff that most of us would consider worth
sharing or finding.

Robert,

Thanks for putting up your web site on old AA5 tube radios. I often
browse through and remember the things that happened over the past 40
years just because I started taking them apart.

But I did manage to get some of them back together :)

Best Regards,

Michael R. Monett

107. Radio formulas - web calculators

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-04 00:00:00 UTC
From: Harry Lythall SM0VPO <harryvpo@hotmail.com>
Message-ID: <01beae50$762add90$8734d693@e0060b0eb282a>
Source record: 69642
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.shortwave,uk.radio.amateur,uk.rec.radio.cb

Hi again all,

I have waddled over to the HTML newsgroups and found the users there very helpfull. As a result I have managed to add the promissed radio formulas calculator (under BASIC INFORMATION) at:

http://sm0vpo.8m.com/ Main page
http://www.geocities.com/SiliconValley/3569/ Mirror in the USA
http://hem2.passagen.se/sm0vpo Mirror in Europe
http://members.xoom.com/sm0vpo Mirror in Far-East

So-far I have added calculators for:

Resistors in series /Caps in parallel (bit of a joke here?)
Resistors in parallel / Caps in series
Reactance of Capacitors
Reactance of Inductors
Calculating basic frequency - LC known
Calculating the number of turns on a coil - single layer
Calculating the number of turns on a coil - multi-layer
Evaluating a heatsink (what does this HS in my hand do?)
Calculating heatsinks (how big do I want to have it?)

Soon, I will be adding T/Pi resistive attenuators and VSWR calculators.
I will also be adding calculations involving sugar/SG and potential alcohol content plus boiling point as a measure of alcoholic content.

Best regards from Harry - SM0VPO
==========
PS
Windows is not the answer - it is the question.
The answer is NO!

> Rick Karlquist N6RK
> rick@area.com

Nifty stuff. I just tried a generic NTE555 diode from the junk box as an untuned, unmatched comb generator (placed across 50-ohm coax, hit it with +20 dB at 100 MHz) and it yielded much the same graph as the HSMP-3820 in the .PDF file. Output was +12 dBm at the 100 MHz fundamental, -18 dBm at 800, and -40 dBm at 1400. Probably lucky I didn't smoke the diode with that much power, but it definitely works! Looks like conversion loss on the 8th harmonic is about 7 dB worse than the HP part, dunno if it's the lack of a matching network or just a cheaper PIN diode. Certainly falls off faster at the high end.

Are you looking specifically for an 8044, or are you
looking for an iambic keyer? In the first case, you
have a tough slog ahead of you. In the second, there
are better ways of doing it now.

The total is what you have the 75 ohm set to plus 2 db. That is 1
db for each of the 50 to 75 pads. YOu will have 2 db if the
switches are set to 0.

114. Recycling an analog satellite receiver (900-2050Mhz) ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-04 00:00:00 UTC
From: "Andrea B." <andrea@logical.it>
Message-ID: <7j8gq3$rt3$1@serv1.iunet.it>
Source record: 69649

I switched to digital and now I have an unused satellite tv receiver.
I'm trying to find a way to use it. Here are a couple of ideas:
- The receiver covers the range 900-2050 Mhz. Meteosat happens to xmit in
the middle of that range (1600 Mhz if I'm not wrong. Could it be done??? How
do I build an antenna for 1600Mhz (is it a dipole ok? Do I need a cavity?)
- I have a couple of those wireless video links. They operate on 2400Mhz.
I'd like to use my sat receiver as a second receiving unit. Of course I
would need a down converter (2.400->1400 Mhz) . Any idea how to do such a
down converter (I think it should need a cavity on these freq.) ?

Have you got any other good ideas
Thanks everybody.

118. Re: 75 ohm attenuator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-04 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01beaec6$fbb12200$LocalHost@default>
Source record: 69653

Depends on what sort and how accurate you wish the
measurements to be made.

When using a 75-ohm attenuator in place of a 50-ohm type
there will be a correction in decibels to be added or
subtracted from the indicated attenuator settings.
Additional hardware in the form of 50 to 75 ohm matching
pads are unnecessary.

It is seldom necessary to know the absolute value of loss
between 50-ohm terminations. It is the difference between
a pair of settings which usually matters. Provided the
smaller of the pair of settings is greater than about 12dB,
the difference will need no correction. The difference in
dB will be near enough the same regardless of the
attenuator impedance.

It is usually possible to arrange an experiment such that
the minimum setting is greater than about 12 dB. This
allows the attenuator, whatever its impedance, to work
between its correct value terminations.

Another way of looking at the problem - if both readings
of a pair are subjected to the same correction then the
arithmetical difference between the pair remains the same
regardless of the magnitude of the correction.

So no real need to purchase an expensive 50-ohm job. In
any case, when it's set to zero there is always a minimum
loss present.

I recently came across a gadget that I can't use because I can't identify it. This thing is about 6 inches tall, and all black metal. On the "bottom" there are 4 numbered "N" connectors. On the side near the "top" there is a male brass Amphenol connector about .75" in diameter with 7 pins and a key. There are mounting flanges to mount this thing vertically, I would guess with the "N" connectors down.

There is a label on the side with the following information:

R.F. Coax Switch
MFR. No. 2831-51
Mod. No. 2LNRP1-1
Ser. No. 15983

28 volts DC
General Communications Co., Boston MA

Naturally, there is no company of that name in Boston any more.

I guess that this thing is either a double pole double throw coax relay with a 28 volt coil, or (more likely given 7 control pins) a 1 input and 3 output remote antenna switch. Perhaps U.S. military type?

Anyone who can give me any information about this beast would be most appreciated!

Thanks,

It depends - if the charger has a current limiter you should be okay. If it doesn't, you could smoke the charger if the battery is very low on charge. If it's a two-step charger then it *probably* has a current limiter during the initial step.

: >frequency of the *equipment*, not that of the crystal.

: > Is it possible this crystal was out of
: >an aircraft radio transmitter and is intended to double to 121mHz?

: If the output on 60.5MHz is truly crystal-controled, then it's almost
: certainly marked as Doug suggests. Normal shear-mode crystals will only
: oscillate on odd-numbered multiples of the fundamental frequency - they
: can't oscillate at half-frequency or twice-frequency.

: Most likely it's a 5th-overtone xtal with a fundamental on 12.1MHz, but
: it will only oscillate at 12.1, 36.3 (3rd overtone), 60.5 (5th), or 84.7
: (7th). You'd have to try much harder to make it oscillate on higher
: overtones.

Jan Crystals used to (may still) have a high frequency overtone schematic
on their price sheet that I've used with success in the 130MHz range. I
think it may have been common base. I could probably find it if anyone is
interested.

1. Isn't it time you learned how to crosspost instead of spamming your
articles into so many groups?

2. Why do you call it the "Oscilloscope FAQ" when it only covers DSOs?
Most of the readers of this newsgroup who have scopes have analog scopes.

Well, Hi!

He did ask for a TTL solution.

I use an RC to delay the 5 Mhz about 90 degrees.
then use an excluse OR to sum both the origional and quad signal,
it produes twice the frequency of the origional.

134. Re: LSTTL Frequency Doubler 5 MHz to 10 MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-04 00:00:00 UTC
From: Tom McDermott <mcdermot@NOSPAM.aud.alcatel.com>
Message-ID: <3758484A.4AE491EA@NOSPAM.aud.alcatel.com>
Source record: 69669

The simplest way is to use a quad exclusive-or gate. Connect three of the exor
gates as delay elements (i.e. one input tied to +5, then input to output is delay).
Connect the source to one input of the 4th gate and the 1st delay gate.
Connect the output of the 1st delay gate to the 2nd, the second to the 3rd, and the
output of the third to the remaining input of the 4th gate. the output of the 4th
gate will be frequency doubled.

Essentially, the source signal (5 Mhz.) supplies directly one input of an exor gate
(the 4th) and a three-times delayed version of the input supplies the other input
of the 4th exor gate. The exor gate will then produce an output pulse for
every input transition (whether positive or negative). This doubles the frequency.
Ideally, the three-delay chain would have a delay of 1/4 the input period (i.e.
for 5 Mhz., 50 nsec of delay), but the reality is that it is totally non-critical,
and does not need to be set.

I've used this technique to multiply up the output of a frequency standard to
10 Mhz where I can then zero-beat it against WWV, and it works very well.

This is aimed at Mr. Cliffton Sharp....Unfortunetly the ham community has to be part of the "cheap shots" you have taken at me and others. I truly had to go to the dictionary and look up the word
" leenyars" and I didnt find it, I had to call a ham friend for him to tell me what the hell you were tring to say! I suppose the term"leenyars" is a term you got from your old CB days that I wouldnt know about. Funny how you would be fimiliar with the term and I had to ask another ham what that word was. I guess "leenyars" is in your everyday vocabulary. And speaking of Camels, if there were no For Sale listings on this group, the other homebrew discussion posts would be about as alone as being on the dessert with that Camel. I make it a point not to advertise commercial gear on this newsgroup and keep it to "parts" for the homebrewer. I wonder why, if you are opposed to forsale items that you read my listings?? I wish you would go crying someplace else, go look for an oasis to retire to and leave the rest of us alone........Lou

Are you saying that because the proper newsgroup isn't what you want it to
be, you're going to go mess up some other newsgroup for your purposes?

I hope you're just saying that you post a few appropriate things once in
a while in appropriate newsgroups where you also participate in things
other than your own sales.

Uh huh. What's "QRO KING", the name of your business?

What's the last discussion you participated in here? Or do you just come
to drop your ploppies and wait for the bucks to roll in?

This is a Usenet DISCUSSION group.

Oh, and as for my "old CB days", I owned a CB once. My employer gave it to
me as a Christmas present. I stole the coiled cord off the microphone and
repaired the mike on my two-meter rig with it, threw the rest away.

If those of you who want rec.radio.maatuer.homebrew to be a sale group are really convinced you are right how about putting your money where your mouth is so to speak? There is a well defined procedure to change the charter of this group (or any other in the rec.* heirarchy). If you want this to be a sale group change the cherter:

1. Post a call for discussion for the proposed change.
2. Afgter a discussion period call for a vote.
3. If at least N people vote, and there are more than M vores for than against the measure passes. I think it is 200 votes total, and more than 100 more yes' than no's.

If you win, post away to your heart's content based on the new charter. Until then abide by the rules of usenet and the charter of this group. If you don't want to play by the rules create an alt.raadio.amateur.homebrew groups where you can do whatever you want. Usenet may appear to be anarchy, but it is controlled anarchy.

BTW, I find it highly amusing that people complain that there are too many sale posts in rec.radio.swap, so they post here instead. Just what do you think this group will look like in a year with the sale postings? If you want a hint just look at rec.radio.amateur.equipment.

Hello--
SUch a product exists-- or existed; it's a metallic-foil lined
jacket that closes via a zipper. IIRC, Spectra Wire and Cable (which
makes SpectraStrip ribbon cable) may have offered this.

Hello Bob

One question.. Isn't anarchy when folks decide
to ignore existing rules and replace them with
their own? Like folks who don't follow charters...

Pete

ps: this debate is raging over on RAR+P. The
Anarchists are gaining.

146. 10 meter dipole with 102" whips?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-04 00:00:00 UTC

Source record: 69681
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hello. I am trying out an idea I had for a rotate able 10
meter dipole antenna.
I bought dipole antenna mount from Jetstream model JTDAK
and thought
I would use 2 102" 1/4 wave stainless steel CB whips I had
laying around instead
of using the 1/2 fiberglass, 1/2 steel whips that Jetstream
sold to go with the mount. (Save $34.00, I'm CHEAP!)
The whips droop 2' lower on the ends than the center. Will
this electrically work? Will the impedance be
so far out and the radiation pattern so fowled up as to make
it useless to even bother to put it up? It
looks somewhat like a inverted lazy U instead of a dipole!
Inverted V's are good, how about a lazy U ?!
I will be using a 1:1 balun to feed it. Your input greatly
appreciated.

Randy KB8ASO

Yes the 2800H will do a cross band repeater operation, the same
remote control operation as the previous dual band radios but it does
not have V/V or U/U capability.

149. Adding shielding to wiring

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-05 00:00:00 UTC
From: BarryG <bgNOSPAM@albany.net>
Message-ID: <7j9rm7$2n2$1@news.monmouth.com>
Source record: 69543

Can anyone tell me if I can buy some kind of braid product that can be
wrapped or zippered around existing unshielded wiring in place and grounded
to provide shielding, without having to disconnect the unshielded wiring?

Tnx & 73,
Barry N1EU

to reply via email, please remove "NOSPAM" from my email address

Well, maybe not, considering where that expression comes from!

So said, in the world of theatre, when you tell some one "Break a leg",
you are wishing that their performance should go so well, they should
have to take a bow!

155. Looking for microwave circuits books

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-05 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <7jauk7apv1@news.netcologne.de>
Source record: 69549

Hi

I'm looking for books about passive microwave circuits, especially filters.
The book should not be overly academic but show how such circuits are
calculated and constructed.

Any suggestions?

Peter

Use a multi-range meter on the ohms range, plus pencil and
paper, a little imagination, and a 24 to 28 VDC supply
via a limiting resistor, to find out everything you need to
know including the circuit diagram.

Assume the RF power handling rating to be the same as that
of the coax connectors.

It will work just fine. Trim it to resonate on your favorite
10m frequency. 102" whips are resonant on 11m.

162. Re: rec.radio.amateur.homebrew IS NOT a complaint group

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-05 00:00:00 UTC
From: Bill <wrc@tir.com>
Message-ID: <37591BF0.FC60F5AC@tir.com>
Source record: 69556

Right here in the middle of the nastiest part of this mess is a good place to insert this:

Some people do not seem able to grasp the simple orginzational concept of a filing cabinet.

We file our documents in a filing cabinet in a standard, agreed order. A document labeled "flower discussion" goes in a different folder than a document labeled "bread recipe". By following the simple, standard we can always retrieve the disired documents.

When some people start tossing documents into the wrong place chaos follows. We can't find a misplaced document when we want it. We also have to sort past it when looking for other, appropriately stored documents.

We could just make copies of a document and put a copy in every folder. That way everybody would be able to find it, even when they are looking for other, more appropriately filed documents.

Soon the file cabinet is overloaded. We can't find the documents we want when we want them. We can't find any of those copies, either... the filing system is completely broken down.

I hope the above analogy can be understood. Perhaps some folks will reconsider their spamming strategies. I do have an interest in appliances and an interest in homebrewing. I come here to compare notes from other homebrewers and occasionally offer help. I look at the swap group, too. There are many posts there I am not interested in, but I just skip to the interesting headers.

I even look in on ebay and the boneyard from time to time. I don't even need a link. I found those and can find any others with the handy-dandy search engines.

Please post appropriately and make the newsgroups easy to use.. like the filing cabinet.

Source record: 69567

It may be resonant already--11 meters uses a 108" whip-the 102" is used when using the 6" long spring at the base. Without the spring, you would use 108" for 11 m. The 102" may be resonant for 10 m, check w/ meter b-4 powering it up--bet it will work fine. -=#Rick#=-.

Clifton, "QRO KING" is not the name of any "business" of mine. "QRO KING" is my e-mail address for my AOL internet account. I am sure you are aware that many people use such "terminology" for their account ID. The name "QRO KING" was given to me by a friend and it kinda "stuck" like an old high school nickname. So when I was confronted with taking on an ID for my AOL account it seemed fitting to use my "nickname". But I can assure you that I have no such businessas you claim, and futhermore could not understand how you could come to that assumption in the first place???
As far as participating in discussions....I am glad you asked that question!! On MANY MANY occasions I have offered advice on questions posted here by others in regards to rig problems or something, but I prefer to send my responses via "private" e-mail to those people, so you rarely see any of my "helpfulness" in that regard for that reason. Is there anyone out there that can vouch for the fact that I have responded privately to any problems that I have offered assistance on? If so please post here. So anyway,some good did come from this whole dialouge, I learned a new word..".LEENYARS"....It was all worth it!!! 73 Lou

181. Re: 75 ohm attenuator

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-05 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01beaff2$d46e56e0$LocalHost@default>
Source record: 69575

When using a 75-ohm attenuator in a 50-ohm transmission
system

OR

When using a 50-ohm attenuator in a 75-ohm transmission
system

as a correction SUBTRACT the following decibels from the
attenuator settings.

Setting dB Correction dB
0 0.00
1 0.02
2 0.05
3 0.09
4 0.13
6 0.20
8 0.25
10 0.29
12 0.31
14 0.33
16 0.34
20 0.35
30 0.35
60 0.35458

The above corrects for the reflection (mismatch) loss at
each end of the attenuator. For many attenuation
measurements the correction is small enough to be ignored.
Above 16 dB, when measurement results depend on the
difference between a pair of attenuator settings, the
attenuator in effect incorporates its own masking pads and
corrections can certainly be ignored.

I've never heard of a YIG comb generator -- is it a YIG oscillator
phase-locked to a conventional SRD comb generator? If so it's probably
an LO module from some kind of spectrum or network analyzer or other
type of receiver. Otherwise, beats the heck outta me.

We have <AGAIN> lowered the prices of all of Clay Whiffen's
remaining equipment including tranceivers and test
equipment.

The IC735 HF tranceiver is now $425. (Picture available)
The TriFuel electric start 8KW generator is now $1650.
Check out all of the TEST EQUIPMENT.
Everything else has lower prices too.
Please take a look at: http://celia.mehaffey.com/k3ix.htm

We have now sold about 2/3 of the items originally listed
and we SINCERELY appreciate the reception our efforts to
dispose of Clay Whiffen's ham radio equipment have received!

Thanks
Joe Mehaffey

Hi All,

Correct me if I am wrong, having done EMI/EMC work for a while but the not grounding both ends advice given below only applies to low frequency noise shielding problems. For high frequency noise a continous bond to ground is desirable and compromises are often attempted using bypass capacitors. Right?

Rob

All,

Second try at writing coherent english. What the Captain MEANT to say was:

Hi All,

Correct me if I am wrong, I haven't done EMI/EMC work for a while. I think
that the advice below to not ground both ends of the shielding applies only
to low frequency noise shielding problems where the objective is to float
the shield and thus not allow noise currents to flow. For high frequency
noise a continuous bond to ground is desirable and where low and high
frequency noise together are a problem then compromises are often attempted
using bypass capacitors from the shield to ground.

Right?

Rob

It will still be basically horizontally polarised as the main radiation is
from the centre of the dipole, the ends don't radiate much.
The same thing was done here about 20 years ago with 5ft helically wound
fibreglass whip antennas. With some fiddling and 6 whips, a shortened 3el
10m beam was made and it worked very nicely indeed.

John, I don't know how it is configured, the metal foil wrapper was stamped with the FSCM number, part number and Title YIG Comb generator, I was told it was for use in a microwave heterodyne counter.

Larry -

After a few dozen email exchanges (some funny, some polite, some rude) I
know you know that the charter of rec.radio.amateur.homebrew forbids sale
items here. What I still do not know is why you think the rules of Usenet
and the charter of rec.radio.amateur.homebrew do not apply to you?

- Bob

201. Homebrew power supply pass transistors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-06 00:00:00 UTC
From: denton sprague <denton@oregontrail.net>
Message-ID: <375AB04F.B06FEDD@oregontrail.net>
Source record: 69595

Hi all, I have a homebrew power supply that I have developed for my stations power supply. I am currently using 2n3055's (6 of them) for pass transistors, but they tend to have a short longivity peroid. I can order a match set from the local electronics emporium, but am wondering if I should invest in something a little more stouter.
Any recommendations? I am using .01 ohm emitter resistors to balance the load.

Source record: 69598

At frequencies above the point where the shield is at least several
skin depths thick (this means at least MF and above for most shields),
you definitely want to ground both ends of the shield. Using a pigtail
or other inductive connection can seriously degrade the effectiveness
of the shield; the most effective way to connect it is by making
contact directly to ground all the way around the shield. Using a
shield and then grounding it improperly is probably a waste of time.

I've never dealt with audio-frequency electrostatic shielding, which
is where I believe single-connection grounding is effective.

Bob Headrick makes it a point to advise every person who posts a for sale of a home brew item on this news group that the post is off topic. Answer him back and you will get lots of maniupulative debate. After a few exchanges with Bob about the meaning of life, etc., he has decided that he will "Call me on the carpet each and every time" !!. Bob is not my schoolteacher, preacher, boss, wife, exwife, neighbor,lawyer , dentist, banker. I havnt crossed his property line, damaged his property, or talked back to his wife or mother, nor have I taken anything from him. I decide how to run my life not Bob. Bob enjoys debating - go ahead and try it. I have lots of snowballs in my freezer for him should he cross the border into Canada, and my aim is good.

The pass transistors should last forever, so you're doing something wrong.
It's probably better to figure out how they are failing and fix the
design problem, rather than switching to other transistors that will
probably also blow.

What is the total output of the supply? How many watts does each
transistor have to dissipate? How hot do the transistor cases get?
Does the supply have current limiting, in case the output is shorted?

Are you using it to charge batteries? In that case, what happens if
the AC power fails - some supplies blow their output transistors in
this event because the base-emitter junction gets too high a reverse bias.

Whatever you use, you shouldn't need a matched set of transistors. The
emitter resistors should cause the transistors to automatically share
the load. However, those resistors seem a bit small. I've seen a
suggestion that the emitter resistors should be chosen to drop about
0.5 V at full output. Even if you're running the 2N3055's at 10 A
(you shouldn't be), a 0.01 ohm resistor generates only 0.1 V of voltage
drop - not enough to compensate for transistor differences.
In fact, there might be more voltage drop across the base connections
to the various transistors than there is across the emitter resistors.
Something like 0.1 ohm is probably much better.

Also, although 2N3055's are rated at 10 A collector current, you
generally can't operate them at that current continuously because
they can't dissipate that much power. And that's true in a power
supply where the transformer voltage is chosen to be as *low* as
possible to minimize heat in the pass transistors.

As an example, I have a power supply here rated 15 amps continuous,
20 amps intermittent. It uses four 2N3055's as pass transistors,
so the maximum current for any transistor is 5 A. A fifth 2N3055 is
used to drive the bases of the 4 output transistors. The emitter
resistors are 0.1 ohm, giving 0.5 V drop at max. output. The
emitter resistors will dissipate 2.5 W at peak output (1.4 W at
max continuous rating) so I used 5 W resistors.

There *are* better transistors than 2N3055. You can get ones with more current gain at high collector currents, making it easier to drive a bunch of them in parallel. Some can handle more power. But it's probably easier to handle high power by having many cheap 2N3055's running 5 A each spread out along a big heat sink, than using half as many of some other transistors running at 10 A each.

Dave

Hi Larry,
I missed the original post, I am always looking for small parts to help me out in my homebrew junk box. What sizes etc, do you have? I am also in Ontario and would like to find other builders who have small parts to swap/sell to aide the homebrewing cause.

Connecting only one end of the shield is a technique often used in commercial sound systems to prevent "ground loops" (AC current flow throught the shield caused by ineffective or improperly connected power system grounds). It *does not* improve shielding effectiveness, it's only a band-aid type fix for other grounding problems. Even at audio frequencies (and especially at RF freqs) both ends of the shield should normally be connected.

From Jack:

I'm just wondering - maybe it's time to think of a different power supply configuration - wouldn't it be cheaper to go switched mode, regulated with some of the new designs from Motorola or NatSemi?

úe's not a builder, he's a seller. I just checked at dejanews, make that deja.com now, and while I didn't bother wading through all the posts, the ones listed for rec.radio.amateur.homebrew are all forsale ads, except for two recent ones where he takes exception to those who rightfully complain about his ads here. The same with rec.radio.shortwave; reminds me of a time when he was selling 100KC crystals there for $12 each, and I posted a response saying that you could get a higher frequency crystal and build an oscillator and divider chain for less than his cost for the crystal alone, and it would give you closer together markers to boot.

It may not be his primary occupation, but the amount of stuff he's selling puts him in the commercial category, which surely would be an explanation of why he defines the newsgroups as advertising space.

You shouldn't have to rely on Larry Asp for coil forms. When I take things apart these days, I'm less likely to save coil forms because I have so many. There are plenty of them in a tv set, and you can find plenty of those waiting for the garbage. The slugs may not be appropriate for your

frequency range, howeever. You can still find plenty of IF transformers in various items, though the transistorized ones can be rather small. The 10.7MHz ones will probably be useful for much of the HF range. CB sets and cellphones too. It depends on what size you need, and the frequency range that you are building something for, something that Larry Asp's ads say nothing about. If you can get by with capacitor tuned circuits, and you can often find small values in various bits of electronic scrap,you don't have to worry about the slugs and simply remove them, or use any household item of the right size as the form.

Some parts are harder to find, especially in Canada. A place here in Montreal that was selling toroids disappeared sometime in the past few year. I think they would have done mail order. I think Laura mentioned a place in Vacnouver that carried them, though I can't remember if they do mail order.

One of the skills of homebrewing is scrounging. Not the dig it out somewhere and sell it elsewhere that some seem to think of as a service. Getting out there to the hamfests and garage sales and looking for suitable items. The Radio Amateurs of Canada have a website at
http://www.rac.ca
that has a list of upcoming hamfests in Canada. The ARRL keeps a similar list at their website
http://www.arrl.org
The fleamarkets less and less seem to have radio-related parts, but what there is often can be a bargain. I've picked up various circuit boards out of FM equipment that can be a great source of parts. One board I got last year had a couple of FM-bandwidth filters and a odd/even prescaler that might not be hard to buy but might be hard to track down as a hobbyist in Canada. You can often find items with similar crystals for making ladder filters. I've never tried that, but since they need crystals on the same frequency I imagine it's easier than the old type where you needed crystals a few KC apart. Every color tv set will have a 3.58MHz color subcarrier crystal, though they may not be the best choice for a filter.

Building something just like in the book or magazine may make it harder to find the right parts, but once you understand the circuit, you can do things your way using the parts you can scrounge up.

Just yesterday I was at a local Rotary Club garage sale. One year at this event I found a box of odd parts which I got for five dollars. It had a serial eprom programmer, the transformer that came with it was worth the price alone, and some ribbon cable and other items of interest.
Yesterday, I picked up a cordless phone for two dollars. I knew from one I bought last year that there'd be a few interesting parts, and when I got home I realized that it was a Radio Shack ten channle phone. Unlike the one I bought last year, this one is double conversion so has a 10.7Mhz ceramic filter and the 10.240MHz crystal to make the conversion to 455KHz. We know from past posts that people are looking for such crystals. It also used common Motorola FM IF strips in both the handset and the bzse.

These items can be hard to get ahold of, yet they are common in such consumer items.

Last week I picked up a cellphone at a garage sale, five dollars and no story about how much it cost originally. It is the oldest cellphone I've found. It has a crystal filter at 45MHz, unlike the two previous ones I bought that had higher frequency filters. Also a crystal to convert that down to 10.7Mhz, and the rest of the 10.7Mhz IF strip. Another even/odd prescaler. A Motorola PLL that appears to have BCD input. A nifty solid case. An NE571 compander IC. It was old enough that none or virtually none of it is surface mount. The output amplifer used discrete power transistors, instead of a module that might or might not work in other segments of the RF spectrum. All kinds of other parts.

One of the earliest things I learned about electronics was that you can make subsitutions. You have to understand the circuit, but that's always helpful anyway. Early on, I realized that a lot of parts are specified in projects because the builder had them on hand, or because they are common parts, not because a given part has some unique importance.

I'm feeling quite rich right now because I've picked up some parts, locally and cheap, that seemed either expensive or hard to get, requiring at the least an order across the border.

And maybe that's the point. It's one thing for someone who is part of this newsgroup community posting about something they happen to have that's unneeded, or someone needing something to complete a project, though it's a slippery slope since ads lead to more ads, as witnessed in rec.radio.amateur.equipment

But if people were discussing where they got their parts and substitutions they made and things they've scrounged up, some of the reasons this newsgroup exists, there would be less likelihood of people saying they want the ads here because parts are hard to get. This newsgroup is supposed to be about communication, whether it's showing someone that they can find parts in common consumer items, or encouraging them to be less timid when it comes to building. This is one place where the magazines often fail, since others can't put in their say (or at least not so easily). The medium fails if people see it like a magazine space, where you are broadcasting a message; people advertising often are seeing it that way, and the QRO King himself seems to see it that way if he really answers questions by email.

I've never looked in rec.radio.swap because being here in Canada I have no particular desire to order from individuals over the border. That's a good reason why I find ads in discussion groups so annoying, since all of it I have to ignore. I imagine it's true for people in the rest of the world. Here in rec.radio.amateur.homebrew it appears that we have a higher percentage of non-US posters. That may not say much about how few post here, but it says something about hearing different angles from other places. I do wonder if the ads started getting worse here if we'd lose them, since surely ads become even less relevant the further away you get.

There are other resources for advertising, and I don't think we hams take advantage of them. Most regions/municipalities have local newsgroups, and and often there are forsale newsgroups. Intended for ads, and topic-ed on local rather than item. If you're looking for something, try posting there. Nothing will be successful until it starts happening. Specialized items may not do so well, until people realize there is a local interest, but you might sell or find other items with success. At the very least, by reaching out into the community at large you might make ham radio more visible, unlike the rec.radio.amateur.* newsgroups where you have to know about the hobby before you'll look for the newsgroup. Years ago, there was an article in 73 from someone who'd placed an ad in a local free shopper weekly, and he wrote about all that he scrounged up that way. Why not start posting ads in local buy and sell newsgroups saying you're a ham and looking for scrap items that you'll gladly pick up?

And I notice the local ham clubs are horrible about using the local newsgroups to promote an upcoming hamfest or other event. Another chance lost at reaching the general public.

One of the local hams has quite an extensive webpage about amateur radio, and I'm not talking about the cross-post kid. One section is a bulletin board type space for people buying and selling items. I'm not sure how well known it is, but that is another way of reaching fellow hams locally. The times I checked it was only commercial equipment listed, but if someone posts about parts, who knows what will happen?

You should be using more like a .5 ohm resistor in the emitters.
You did not state the voltage and current of the supply or the
transformer voltage. You may not be aboe to draw but about 5 amps
per transistor. You also might try some 2n3771 transistors (astrom
uses 8 of them for about 50 amps)or there are several in the 2n377x
series that look good.

Not an expert with the satellite tv receivers but I guess that it has a 24v
feed to the LNB
on the centre of the coaxial you will need to block or interrupt this before
connecting an
aerial to the socket or you will blow the psu in the satellite tv receiver.

As for an aerial (antenna, sorry I use the ENGLISH words here in the UK. Hi
Hi)
have a look at the ARRL Antenna handbook or have a look in your local
library for
ham radio books that describe antenna projects.

Cheers Martin G1GYC

Kevin -

You don't mention if you are looking for CW or SSB. The Norcal 40, now sold by Wilderness radio is a nice single band CW rig. It is very compact, and has room inside for batteries. The Cascade was a little larger version which covered 160-15M with plug-in modules.

For SSB the Sierra from Norcal works well for 80 and 20M. All these have fine receivers, it is usually easy to hear much more than you can work with the 1-5W outputs these radios have.

I used for several years 75 ohm attenuators for extensive measurements
on HF/VHF, usually it is little practical difference between 75 and 50
ohm attenuators, except for low attenuation, - as long as impedance is
not too critical, so just use your tool and forget that it is made for
75 ohm

231. Eight-Year-Old Elmers Directory Needs Elmers!

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-07 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <AbY63.29982$OL.718144@newscene.newscene.com>
Source record: 69490
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radio.amateur.space

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself). You may also access the Directory at:

http://www.novia.net/~pschleck/elmers/

The Amateur Radio Elmers Resource Directory is 8 years old as of March of this year. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire Directory every 2 years, I am constantly scouring the newsgroups for new Elmers to join the Directory.

There's always been an implicit invitation for any qualified person to join the Directory. However, since I've lost the half of the Elmers listed due to attrition from the last biannual mass-ack (i.e., no response at their last-known E-mail addresses; the 50% attrition rate seems to be fairly predictable based on the last few mass-acks in recent years), I felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the Directory right now include:

- Any expertise from residents of states, provinces, and foreign countries not currently represented
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats, SAREX, and ARISS)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95/PalmPilot
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, NACEC, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)

- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to, existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. You don't even need access to netnews, just a reliable E-mail address.

If you'd like to volunteer, please go to the following Web-based registration form:

http://www.novia.net/~pschleck/elmers/register.html

Many of us were been using the Internet for years before MS-Windows could
even begin
to talk to the Internet using UNIX. Telnet, ftp, NFS, gopher, Archie and
hundreds of Internet apps were
online long before MS-Windows even knew what TCP/IP was! Remember that
Mosaic (Netscape)
was first written as an X-Window app!

Also, check QST... It was not a one transistor job, but it was fairly simple.
It was back about 2-3 years ago as I recall.

I think your're right regarding what it is. I found a reference during a web search that describes the function. the web site is http://www.micro-lambda.com/multipli.htm if your're interested.

Rex Allers wrote:

240. Re: ? registration of double sided boards

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-07 00:00:00 UTC
From: Tom Bruhns <tomb@lsid.hp.com>
Message-ID: <375C6FC1.8B0F1CDA@lsid.hp.com>
Source record: 69499

I've only made boards using photoresist, and my method only applies to that. I make transparencies with pads in the corners just for registration. I tend to use full 8.5*11 inch sheets, even for small boards. I trim one transparency to be a bit smaller than the other on each edge, align them, then tape opposite edges with "Scotch" tape. Then I slip a board into the middle of the sandwich, and tape it to one of the transparencies. That sandwich goes into my print frame, which is just a piece of 1/8" plate glass over a piece of foam over a piece of plywood; the weight of the glass (15*15 inches) is all that's needed to hold things together. I get registration consistently good enough to do "vias" with 0.040" pads, drilled 0.0135" (for 30-gauge wirewrap wire).

By the way, I'm presently pretty happy printing overhead transparency material on an HP "PhotoSmart" printer, which puts down multiple dots to get a dense ink coating. A previous inkjet printer didn't print densly enough, and I had better luck laser printing on very thin vellum or tracing paper, and just using that; the paper is translucent enough to work OK. Also, do print as you would with the p-n-p, I guess, so the printed pattern goes against the board with no transparency material between to let light leak around the edges.

(For p-n-p, I might try a similar sandwich thing, if it seemed practical, or else drill registration holes. I'd make a jig to drill the holes so I could get them "exactly" the same spacing as some registration pads I put on the p-n-p.)

Hope this helps...

Cheers,
Tom

Source record: 69501

I am a professional software engineer and a long time short-wave
listener.

I have developed a Windows program that allows you to filter audio in
real-time.

Connect the "Line Out" on your short-wave radio to the "Line In" on your
PC's sound card.

Use the Windows "Volume Control" program to assign inputs and outputs
and set levels.

The program takes the digitized audio, filters it and plays it out
through your PC's speakers!

No special hardware or modifications needed.

It does require a fast PC - 200 Mhz or better.

For more information and a free Shareware copy of the program visit my
web site:

http://www.winternet.com/~swezeyt/dsp.htm

Thanks a lot,
Tom Swezey

Who cares about what the military uses we are not the military
and by the way a few special forces still are taught it guess who?

Some people still collect and use old HF gear older than most of
us. Still sounds good on the bands so are they obsolete beyond
use? Get real and quit beating a dead horse issue. Remember and
respect your roots! After all without amateur radio opertors/developers
where would communications be today,so let us all enjoy the NOS... ok!

Don't know for sure but its probably part of a counter. Its probably an SRD comb generator followed by a YIG filter. Would work something like this. Input would be maybe around 1 GHz. First would be an SRD multiplier to generate harmonics at 2, 3, 4, ... GHz. Following that would be a YIG filter. Current to the YIG coil allows only one of the frequencies to pass. By adjusting the current you can select which one.

This is probably what it is. Output would be use to mix with input frequencies in a microwave counter. Can create lots of accurate refrence frequencies if the input is accurate.

Sorry, I don't know about connections or frequencies for the one you have.

If a CW-only radio is OK with you, consider the Ten-Tec units.

I don't have any real experience with any of the competing units, but I
just finished a 1320 for 20 meters. The receiver is more
intermod-immune than my TS-940. I did hear a bit of breakthrough from a
shortwave broadcast station last night, but only one. IF bandwidth is
about 1kHz (may be a bit wide for some tastes). VFO stability is good,
and the unit is fairly easy to build.

There isn't much room for anything inside the case though. (anyone know
how big a Tick keyer is? I have a Ten-Tec keyer using a couple of CMOS
chips but it's too big..)

Price is $95.

Try drilling the board first, then aligning each side of the board with the holes. Then etch the board. This was you can see any "runout" and get the best fit.

I havent tried this with the press n peel, but see no reason it should not work. Make sure the holes have no burrs using a carbide drill.

248. FS: new old stock Cornell-Dubilier paper-in-oil capacitors

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-07 00:00:00 UTC
From: dmwilliams@tande.com
Message-ID: <7jg15hiqh1@nnrp1.deja.com>
Source record: 69621
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi Everyone,

I have a box of new old stock Cornell-Dubilier paper-in-oil capacitors
for sale.
These are type DYR 6011G
(2) x .1 MFD 600VDC - 7NKO +/- 10%
Use as two .1 mfd's, one .05 mfd, or one .2 mfd.
They are the rectangular hermetically sealed metal case variety with 3
solder lugs.
They measure 1.75" by 1" by .75", not counting the lugs and mounting
ears. The
following addresses lead to photos:

http://www.geocities.com/Paris/1665/doug/cd1mfd1.jpg
http://www.geocities.com/Paris/1665/doug/cd1mfd2.jpg

The paperwork with the box gives a manufacturing date of November 1944,
and
states that the test voltage was 1000VDC. I have taken capacity
measurements on
the entire box, and they all measure within specification.
I am selling these for $4 apiece, or $6 apiece if you want exact
matching.
Please write if you have any questions or interest.

Thanks, Doug Williams

If anyone can possible help me...

I live in South Africa where amateur radio is completely unheard of but have been working on a community radio station now for almost five years.

I want to start up the first amateur radio station, or even my own community radio station ... but all in good time!

I have a fair amount of technical skills but am COMPLETELY in the dark about this subject. I have been to numerous websites even but have barely understood one word.

I want to build my own FM (or MW) transmitter!!!!!!!!!! Does anyone have a clue how or if it is possible to do such a thing??????? Transmitters cost up to R1000 000 here. NO way!!!

PLEEEEEASE help. Send mail to madjon@rmr.ru.ac.za

Kurt Arico wrote:

> Does anyone know where I can find some circuits for a 1 transistor regen
> receiver? I modified a tube circuit that used a 30 and was dissapointed in
> the results.

I remember an article in 73 some years ago by someone who had followed that path, with similar results, and so set out to come up with a good design. I think he ended up concluding that a FET was a better choice for the "traditional" regen designs, but offered some workable circuits for BJTs. Substituting a 2N3819 for almost any early triode has often worked for me.

Message-ID: <19990607203219.26257.00001304@ng-fm1.aol.com>
Source record: 69504

I custom build <1 at a time> some darn nice 2 meter antennas!

3 EL Yagi-30.00 These are all aluminum, gamma fed, nice looking and
working
yagis...The Jpole is all aluminum, goes together
in 2 shakes,
4 EL Yagi-37.00 and is 3/4 wavelength long. These are excellent antennas,

and have sold out at local fests and club
meetings each
5 EL Yagi- 43.00 time I bring 'em.

Jpole<3/4 wave length>-23.00

Each antenna comes with an instruction sheet and all hardware to have it up and running in minutes. The yagis have gamma rod assembled and attached to the driven element. The Jpoles come with pre-drilled set points for tuning at 3 points in the band.

I am not some web scammer, I just like building antennas. You can reach me by this email address, by my call book address, or by sending a note to my call sign at PO Box 2189 Schiller Park, Il 60176.
Chicago area hams may arrange for local pickup.
SHIPPING IS $8.50, regardless of antenna. I will ship 2 of any one for $11.00.

INCLUDE YOUR EMAIL ADDRESS IF YOU ORDER BY MAIL...Checks or Money order payable to Doug Adair only...this is not a big business...I am just having fun and helping new hams not GET RIPPED OFF!

Thanks guys...73 and CU on 6 METERS!!!!!!!!!!!!

261. CD Servicing Convention Reminder.

G'day all Australian Tv / Video techs.Are you not as sharp on servicing
CD's and DVD's and ROM drives as you would like to be. Then come along to
the 1st CD convention and polish your skills.
We will be instructed by Mr Max Pisano [ex R.M.I.T Lecturer]

The date is Wednesday July 7th 1999.and bookings close 11th June 1999 this
coming Friday.

For further information have a look at Max's Web site.
http://cdservicing.find.com
or call him on 613-9384-1951 or email him at maxp@primus.com.au

THIS SEMINAR IS INVALUABLE TRAINING FOR ANY SERVICE PERSON.

Yeah thanks.
Urm, can someone scan that for me?

I don't have the dough to buy that book, and my local library doesn't have
it...
Please post here before, so I don't get, like 3 emails with attachments!!!
73s in advance ;o)

I feel your pain! :-)

Check out the wee-little tone encoder that Communication Specialists
sells. It goes for about $29 or so. I've stuck these in an ol'
Azden PCS-4000, an ancient IC-22A, and others.

hello
im wanting to put a oil filled cap in a HB amp and the caps are to tall to
stand up and mount

can you run a oil filled cap on its side

these are brand new caps 32 at 4000 volts want to run two for 16 at 8000

but just not sure if they will run side ways????????

thanks for any replys
joe

From: Don <bjmcpher@usit.net>
Message-ID: <375CAC2E.98C4CB12@usit.net>
Source record: 69511

Thanks, Jim

One of the problems with this presnpeel is that its pretty much opaque, so you cant really see through the film to see where a pad hole is alligned with a drilled hole in the board. I think what i may try is to iron on one side of the board, and pick a few pads and drill some tiny holes (about the size of a straight pin or needle maybe. Then poke some holes in the film to be used on the other side and use the pins to allign it. Maybe I can use a cardboard box or something to pin the whole mess on, then iron it just enough so that the stuff is sticking in at least a few places, then remove the pins and iron as per usual. I dont know how it will turn out. I may move to photoresist when my pnp runs out if it doesnt do well.

God No!! It is my job and my hobby. I love radio construction. Funny thing, I design and build a project, make a couple of prototypes to get it 100%, then it goes in a drawer with the rest and I start on the next project. I never seem to have the time to actualy get around to using my radio equipment, I am too hapy building it!

269. Mic pre-amp/EQ schematics wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-08 00:00:00 UTC
From: tim@timwellman.com
Message-ID: <375dba27.56535983@news.zoomnet.net>
Source record: 69513

Have looked all over the net and various books and can't find a decent mic pre-amp with a built in EQ (even 2 band OK). Does anyone have schematic for this? (Should be relatively easy... I can built a preamp with a 741 op-amp, though this might be too noisy, and I don't know how to add the EQ sections.. I saw schematics for this once, but the local library recently took all the larger ham radio books out of circulation... said they were taking up too much shelf space)

Anyway, if you can help, please email me:
tim@timwellman.com

Thanks in advance!

Hi All,
Looking for instruction/users manual (copy?) for an RCA WV-98B
Senior Voltohmyst VTVM. Unit needs calibration and while procedure seems
pretty straightforward, I am a bit unclear on the setting for a pot marked
"AC-Z". Any help greatly appreciated & I will gladly pay any resonable price
for the manual or a copy.

Thanks!

Steve

OA3 / VR-75 G.E. NOS in box QTY 3 $3.00 each
OA3 / VR-75 Marshall Electronics in box $4.00
3AW2 Philco Used in G.E. box $0.50

(Total over $170.00)

Take all 47 of the above tubes for only $79.00 plus shipping

= = = = =

Bud Box, diecast, 4.5" X 3.5" X 2", new, no cover plate $4.00

= = = = =

ARRL Handbooks:
1973, 1975, 1978 at $10.00 each
All in excellent shape

= = = = =

Plate variable transmitting capacitors:

0-250 pF Hammarlund transmitter plate variable, 1200V
Marvellously constructed. This is a beauty!
New in Box - $18.00

50 pF 500V Variable capacitor assembly, with link-coupled
tank circuit. 12 turns on a ceramic 1/2" form. 6" Coax link to Type N
connector. Capacitor has 3/8" bushing or screw mounted on base.
Includes
antique knob and small bakelite panel. $2.00

Automatic Brand type C6T air variable capacitor. Mounts with two
screws.
30 pF at 200V. WIth screw slot adjust. Has silver-plated 3.5 turn coil
for
2m attached and porcelain standoff. $1.50

80 pF air variable trimmer capacitor, two screw panel mounting.
Screw-slot adjustment. Used $1.50

= = = = =

Headphones with boom microphone.
Jensen Model JMP-41
Headset Response is 20 Hz - 20 kHz
6' Cord with mini stereo plug.
Microphone is Low-Z Condenser type with 2.2 k-ohm impedance.
Response 30 Hz - 16 kHz

Durable and comfortable design with padded ear-pieces, ideal for
communications applications.

Brand new in box. White color.
Great for mobile HF or VHF operating. Think SAFETY!
Also great for extended rag-chews, contesting etc.
No PTT, but has standard connectors - 1/8" mini-style.
Will also work well with computers. Normally $29.95
New in box $20.00 plus shipping

= = = = =

Add shipping cost to all prices.

Contest period is Jun 12-13(2PM east Sat through 11PM east Sun)

The Murgas ARC will be operating limited multi(6m, 2m, 220, 440) during the ARRL June VHF contest using the callsign K3YTL. We will be running all 4 bands on FM, SSB, and CW from our FN11uh location(northeast PA.) The exchange is a simple call and grid square(see http://www.arrl.org/locate/gridinfo.html to find your square if uncertain.)

2 meter FM will start at 5PM Sat on 146.49 MHz and146.55. Both freqs will be operated on at the top of every hour. Dial around since we might be forced to move if band is crowded. We hear lots of people even though you may not. All other FM should be continuous. CALL US ON 52.525, 223.5 AND 446!

SSB/CW activity should be audible all of the time. Just work us. Answer our CQ's.

All of our stations will be connected, so when you work us on one band simply ask for a schedule on a different band and you can score another contact immediately. Simple!

We thank everyone who participates in this wonderful event. Good luck and happy hunting. CQ contest!

I'm not sure if Analog Devices has put older issues of Analog Dialogue online (yet), but they have started distributing it that way. It's a good place to look, for sure. They've had preamps and equalizer circuits discussed before there. I really think you don't want to try to use an LM741 in this application. At least use an NE5532, which is reasonably low noise and good audio quality. If you are using a low impedance mic, then an Analog Devices AD797 would be a good choice: very low voltage noise (good for low impedance, low level sources), very low distortion. I think some of the National Semiconductor op amp data sheets have diagrams for adjustable multi-band equalizers.

Cheers,
Tom

Source record: 69527

I thought Dave Martindale's reply was right on. 0.1 ohm emitter ballast resistors are going to do a lot better than 0.01 ohms. Even 0.05 ohms could work, with some care. I'd say that 0.5 ohms for 2N3055's is _probably_ overkill and would waste quite a bit of power at 5 amps, which is a reasonable max for the 2N3055. -- A good way to pick the emitter ballast resistor is to get about 0.6 volts drop at peak current. Then you can easily implement current limiting by just using that ballast resistor drop to turn on a transistor which sucks base drive away from the transistor that drives the output stage. You can also modify that to get foldback limiting if you wish. Look at some typical designs to be sure you get things right...you need a resistor to limit the base current on that sensing transistor, for example.

An issue that I didn't notice Dave or the others addressing is "second breakdown" in bipolar power transistors. If the devices have much voltage drop, they are subject to catastrophic failure at well below their maximum power dissipation. "Much" can be as little as ten or fifteen volts, though the problem is much worse at higher voltages. See the data sheets for the type of device you are using, and be sure they are operating within each and every spec: power dissipation versus case temperature, max current, max voltage, the second-breakdown curves. Even then, eventually thermal cycling will kill them: for maximum life, keep the number of thermal cycles and the delta-temp for a cycle low.

Cheers,
Tom

Hello--
Tom Bruhns offers some excellent advice in another post, but be
aware that not all 2N3055s are created equal. The specs are relatively
relaxed, and some transistor manufacturers branded their "fallout"
power transistors as 2N3055s-- even though the devices featured
different
internal technologies.

For example, a triple-diffused "2N3055" would exhibit much better
HF performance (and different breakdown characteristics) than an alloy
2N3055 version.

If you can, locate some Motorola-branded 2N3715s/2N3716s, or RCA-
branded 2N3055s. Sometimes, it's useful to dissect the failed
transistors and compare the duds with a dissected known-good
device.

anyone see the adam-12 episode where malloy got shot? his radio mic
was smashed and the only way he could communicate was to 'key' the
radio on and off. he sent a bit of morse code, was cool.

morse code is pretty cool, you don't need a radio to use it.
a mirror and sunlight works too.

anyway, i thought i might throw this in. my repeater is
voice id heavy, i was asked to add more morse code id
in the mix by my friend. after this suggestion,
i made a few rotating bulletins with morse code followed
by a voice counterpart to assist a tech ham in getting some
copy practice right from my repeater. it appears to have
helped alot. upgrade in sight =]

My guess is that it is a device for switching in and out a phasing leg of coax for switching phasing (directions) of a pair of phased verticals. Check and see if there is continuity only between two center conductors with no power on. Then put power on and see if each of the two that were continuous are now switched to the two other connectors.

Can anyone recommend a source of prescalers for coverage of 3 to 12 ghz?
I have seen a few NEC products like the UPB502, UPB506 but I am told
they are being obsoleted.

Thanks beforehand,
Vince

I can e-mail you a .pdf file of my latest effort called the ElmeRadio.
It is the simplest high performance regen circuit of which I am aware.

If you prefer, you can also view .gif files of this project at
http://www.ccm.net/~kf9li/elme/

FWIW, had pretty good luck with equalized PNP/NPNs at up
to 30A controlled by a 3-term regulator, LM317K/350K.
Seems the rules are...
1. most any 3055 and up work OK
2. about 5A per pass transistor
3. heavy pass heatsinks and fan
4. lightly heatsink regulator so will auto-shutdown before
pass transistors go. this is cut and try...
5. keep Vin to a minimum

304. uk.radio.amateur car battery as power source

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-09 00:00:00 UTC
From: Mark Barker <mark.ba@far-out.demon.co.uk>
Message-ID: <DrB2FGB18tX3EwOT@far-out.demon.co.uk>
Source record: 69448

Although a car starting battery is is not originally designed for any depth of discharge it can be economical initial purchase and possibly last as long as a deepcycle battery if treated well.

Apparantly it's the time it spends in discharged state that kills it, not the depth of discharge. Sulphation crystals and shedding whatever that is.

Anyone have practical experience of using sucessfully a car battery to run 12V powered transceivers while in a temporary location?

Is it really true a car battery never recovers from a deep (say 50%) discharge?

There was an excellent article published in the March, 1994 issue of Electronics Now, page 66 called The Lost Art of Regeneration by Charles Kitchin, N1TEV. He says Look again at the classic regenerative receivers and their importance in radio history, and build these modernized, transistorized versions. Check your local library for back issues of this magazine.

The same article with some revisions/additions was published in the Fall, 1995 issue of Communications Quarterly, page 7. If you are not familiar with this magazine, I consider it to be the current version of Ham Radio magazine, with more emphasis on high powered technical articles than QST, CQ, etc. Let me know if you don't have access to this article.

Good operating regenerative receivers are tricky to build. Many people, including myself, have not built one scratch that we were completely happy with. I had a noisy pot in my SW-3, and after replacing it, the receiver "blipped" into regeneration instead of occurring smoothly. Since I used an Allen Bradley pot and the receiver worked fine before, I moved some of the wires. It worked fine again, but I couldn't see why the slight change in position of one of the wires did the job.

There's a reflector where the subject of regenerative receivers (usually tube type) occurs frequently. It is "Glowbugs". Copied from the list:

Hello all. I have a pile of CB radios that I have collected over the
years and while looking at them today I had an idea:
I like to run SSB on 10m and usually don't monitor the band too often.
I am thinking of modifying my Hygain VII to recieve in the 28Mhz area to
use as a monitor. Any ideas?
I fiddled with adding a varcap but was only able to drag the thing off a
few hz.
I assume I need to change the IF crystal to something lower.....
Any help would be appreciated by this wanna-be
Jim

Well, it's not as common as I thought. But there's a three-band tone control in the TL082 and LF353 data sheets, and an active tone control (bass and trebel) in the LM148/149/248/348/349 data sheet.

Actually Mr. Young, I'm opposed to internationally mandated code testing. Just go look up that
statement that the FCC made that says the treaty does not specify what speed you need to learn
the code at. You need to know the code, but not the speed at which it is sent. I gathered this information from http://www.arrl.org/news/restructuring/98-143/nprm.html.

>significant
>base bias. To a first order, it's not a termally-induced event.

I looked in Horowitz and Hill, which I should have done in the first place.
They explain second breakdown and safe operating area quite well.

Briefly, bipolar transistors have a positive temperature coefficient
for collector current at a fixed base-emitter voltage. When you
parallel several transistors in high-current applications, this can
result in one transistor "hogging" most of the current and destroying
itself. One transistor starts out taking a bit more current, so it gets
hotter, which causes it to draw an even larger portion of the current,
so it gets hotter yet, and so on. The fix with multiple transistors
is to use emitter resistors, so increased current reduces the base-emitter
voltage and all transistors share almost equally.

The same current hogging can happen *within* a single transistor - one
area gets hotter than others, draws more than its share of current, and
destroys itself. The problem is reduced with pulse loads, since there
isn't enough time for the thermal effects to occur. To avoid second
breakdown, the transistor voltage and current have to be limited
to values where there isn't enough power available to create this
localized thermal feedback problem.

Note that this can happen even when the current is below the maximum
rated current and the voltage is below the maximum rated voltage (so no
avalanche leakage) and the power dissipation is below the rated limit.

FETs have a negative temperature coefficient, and so they automatically
share current evenly - hot spots cause *reduced* current, which reduces
heat. So no emitter resistors are needed when paralleling multiple
transistors, and there are no "second breakdown" effects to worry about
within a single transistor. The operating limits are set solely by
maximum current, maximum voltage, and maximum power dissipation.

Dave

316. 6 meter 1 watt PA help needed

Newsgroup: rec.radio.amateur.homebrew

Any VHF or higher signal can easily use LORAN C signals on 100KHz. All
one has to do is receive 100 KHz and impress that signal as a subcarrier
on the VHF signal. The receiver simply demodulates the VHF signal,
impresses the "audio" into a LORAN C receiver, and the radiosond position
is known. Cliff K7RR

For Sale - New In Box, HS-16A military headphones. In original never opened packaging. These are based on the late 1930s design and look like the old "cans" we all know. Except the headband is covered in an OD colored fabric. 600 ohms AC impedance I'm told [maybe 500], measures 105 ohms DC with an ohm meter.
The cord is of the tensile type and ends in pin tip jacks like of old. There is a FSN of 5965-160-1055.

The manufacture date code on the packing is 12/65. I'm told the military had a large stock of this old reliable design made for Viet Nam which were never used.

Price $10.00 - includes postage by priority mail.

Yes!!!

Nuclear X-rays and Prompt Gamma pulses create a very broadband Electromagnetic Pulse (EMP) that easily exceeds 50,000 volts per meter (50,000 times 80meters/2 (half wave) equals 4,000,000 million volts across your 80 meter dipole). By the way, that is 42 billion watts in 377 ohm atmosphere across your antenna!!!!

During the 50's when Above Ground Nuclear testing was being performed, the STARFISH event, 700 miles from Hawaii, turned off the power grid in Hawaii. That was in the days of Vacuum Tubes...what happens today in the solid state world?

Extensive studies and tests have been performed in this area...nuclear weapons x-ray and gamma radiation will kill your radio and most everything else.

A "bridged-T" notch should do the trick. Connect a 47 pF in parallel
with about 47 nH and place this tank in series with your cable. Now
add a variable resistor from the center of the coil to ground. Adjust
the resistor and the tuning of the tank for max dip. You can also
use two 100 pF caps in series and use the center connection for the
resistor tap. (But either the cap or inductor needs to be an
adjustable type. The resistor will be in the low hundreds of ohms. If
you are transmitting power through this arrangement then you might
first try a simple series trap to ground made from a .33 uH coil and
a 0-10 pF trimmer. Both tanks are intended to resonate at 105 MHz -
in case I made a math error!

328. Re: P.O.W. "tap" code compared to Morse code

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-10 00:00:00 UTC
From: tatasadasayago <Jcrosley@mocc.com>
Message-ID: <375F6DF0.86226F6E@mocc.com>
Source record: 69460

The Air Force types used a hierarchy based system of dits to count groups of letters starting with ABCDE then FGHIJ etc. so 5 taps or DITS annotated the 5th group, after a pause, the next dits designated the particular letter in that group. In comparison, Morse is simpler to use, but many have trouble differentiating between the dits and dahs. Those of us in the Army used normal CW, and if a masonry wall was the medium, the knuckle was always a dit and the bottom of a closed fist was a dah.
In one particular incident I thumped the dirt with my boot and smacked small sticks together to form copyable Morse that could be heard well out to 30 feet from my position. My spotter and I used tactile morse to communicate in very dangerous circumstances where even a whipser may cover the sound of an approaching enemy.
Thumb was dah and tip of forefinger was dit.

>fifteen volts, though the problem is much worse at higher voltages.

What's the mechanism of second breakdown?

When designing a linear supply, it's generally a good idea to keep the transformer secondary voltage as *low* as possible - just enough so that the troughs of the ripple waveform are still a couple of volts above the output voltage at maximum output current. This provides enough voltage to deal with the drop across the emitter resistors while keeping the collector-emitter voltage as low as possible to minimize power dissipation in the transistors. (Of course, with less load, the unregulated voltage rises, but the current drops, so net power should go down).

It sounds like this would also automatically reduce the chances of second breakdown.

Dave

depends on what you consider cheap. One could build a filter
out of a quaterwave length of cable with a T-connector
Just insert the connector in the line (between TRX and ANT)
and connect the
short pice to the third port. Prune the the cable until you
get to the desired frequency. Much better would be to build a
cavity filter.. but that would take some skill and the material
ofcourse.

Here is one for broadcasting applications:

Hi,

I have a number of UPS power supplies of varying output for sale:

Ideal for PC power backup / electronics fiddlers. run a 240volt light bulb when the power goes out....whatever.. (Aimed at the PC user)

They range in size from a unit that sits nicely under you monitor and will keep your PC running during a blackout / power failure for about 6-8 minutes

Software available: PC interface for batt diags/ and autonomy checking etc etc.

Small sized one PC for 8 mins

Medium sized units approx 20 minutes (or two PC`s for 8 minutes)

Large capacity (suit server backup) 1-3 hours.

prices are roughly $50 for the small
$200 for the med
$500-$1000 for the large units (call to discuss)
(The large units are large in size and rating. they are for multiple server backup applications during a blackout.

They are "ex stock" that our company does not want to support any more and have "written them off" there is i roughly $64,000 worth of units that i have been given to sell.

for the Tec's out there... they are a "on demand" type where is they can just be switched on and they will run a 240v device from the batt pack (like a inverter) or stay plugged in live and when the power fails keep running for period X (rating dependant)

(i have limited specification sheets for most units)

Please phone Richard Gormley onM0414 970 489 or H: 9255 5294

They come as is "NO claims if it goes bung" they have all been tested working all units can be seen working any test welcome.

PS if some one is interested in BULK dealing for resale (scrap lead from the batteries perhaps??) whatever... please call and i will do a really cheap deal...

Regards,
Richard

This allowed a total of 25 letters. The letter C is sent instead of the
missing K.

Michael.

In order to track the radiosonde accurately to accurately calculate
wind speed and direction, some radiosondes contain a radio
navigational receiver. The received signal or calculated position is
multiplexed on the UHF downlink with all the temperature and pressure
measurements. The ground system then calculates the position from this
information.

I have heard of radiosondes carrying a GPS receiver, but apparently it
is much simpler to use the Omega signal, which is/was transmitted on
VLF and the signal is simply relayed down to the ground station and do
all process on the ground.

: I want to tinker with this, but have no info on the voltages, etc. I
: have a battery, but is dead and not marked as to the voltage.

At least the Vaisala radiosondes use a battery, which is activated by
adding water to it, so the battery looks dead when dry.

Thank you, Jim, for a very interesting post. I had always mistakenly
assumed that a variation of "Continental Morse" (the old clicking
telegraphy mode) was used, and have always been frustrated that despite
reasonable skills in conventional Morse, I've never been able to train my
ear to "hear" telegraphy. Your explanation makes it clear -- and helps
to reduce my frustration level! :-)

Source record: 69474

tatasadasayago <Jcrosley@mocc.com> writes:

CB-band to 10M band....I was pleasantly surprised at how simple it can be.
I was especially interested in SSB for 10M since my son just got his
Tech-Plus license and can operate on 28.300 MHz to 28.500 MHz SSB (apparently
AM is illegal). His "wife's budget" only permitted something "cheap".
I bought a couple of "working" SSB CB's for $20 each at a recent Hamfest...
Midland model 79-892, and a Cobra 138. The Midland uses a PLL-02A phase-
locked loop synthesizer to control the 40 channels, and the older Cobra uses
10 quartz crystal oscillators to control its 23 channels.
I suspect there are dozens of other brands that have almost identical design.
I remember converting a 23-chan Kraco (AM) many years ago which used a PLL.
I was fortunate enough to get service-info (SAMS PHOTOFACTS) thru our local
library....CB-180 (April 78) for the Midland, and CB-57 (Sept 74) for the
Cobra.It's a good feeling in our throw-away society, to be able to re-cycle some
of this great equipment of yester-year.
Converting the Midland is quite simple..its PLL has nine control lines
capable of divide-by-n (1 to 512). The Midland only needs to divide by 255 thru
211 for Chan-1 thru Chan-40 respectively, so that the 256 line (pin 7) is
disabled permanently (grounded). Since a division of at least 211 is needed,
the 128 and 64 lines are always enabled (tied to +5), and the remaining six
lines (pins 10 thru 15) are switched by the Channel Selector dial to progress-
ively lower the count from 255 thru 211.
These values may only apply to this model, or perhaps other Midland models....
they depend on choice of VFO and I.F. frequencies, and the down-shifted fre-
quencie offered to the PLL, which always divides-by-n to reach 10 KHz which
provides phase-locked-loop control, to force the VFO to move in 10 KHz steps.
In this particular model for example, on Chan-30 the VFO runs at 38.000 MHz
mixed with an I.F. frequency of 10.695 MHz to provide the Chan 30 frequency of
27.305 MHz. (This is a good example because for converting to the Novice band,
we will want to start at exactly 1 MHz higher...at 28.305 MHz). In addition,
to down-shift the VFO for manageable frequencies for the PLL, it mixes it with
a fixed 40.210 MHz for a difference of 2.210 MHz (on chan 30). Dividing this
down to 10 KHz requires a divide-by-n of 221....of which div-by-192 is perm-
anently wired as described above (pin 7 LO, pins 8 & 9 HI), so that only an
additional div-by-29 is needed and the Channel selector knob supplys this (on
chan 30) by grounding pins 10 and 14, and enabling (to +5) pins 11, 12,13 and
15. Pins 7 thru 15 represent div-by: 256, 128, 64, 32, 16, 8, 4, 2 and 1, res-
pectively.
As a side note, many people do not realize that below Chan 20, there are
five places that adjacent Channels actually jump 20 KHz, instead of 10KHz:
...i.e. between 3 & 4, 7 & 8, 11 & 12, 15 & 16, 19 & 20 ....all are separ-
ated by 20 kHz. The remaining channels thru Chan 40 all have 10KHz separation.
I hope all this expanded theory will be helpful in analyzing some of the

various models on the market.
GETTING BACK TO HOW SIMPLE IT WAS TO MODIFY MY Midland 79-892, all I had to do was cut the PC-board foil to pin 8, then connect pin 8 to pin 7 (which was already grounded). Then tweak the slug on the VFO counter-clockwise to raise its frequency to 39.000MHz which raises the operating frequency to 28.305 MHz as mentioned above....but if you are expecting to receive or transmit on 28.305 MHz, the Chan selector needs to be on Chan-6. The VFO can is the largest shielded-can about 5/8" x 1 1/8"...much larger than any others...with the ferrite slug on top. Operation will not "pop in" until you tweak the VFO near enough for the dc control voltage to capture contol of the VFO. Until then, an out-of-lock signal will disable the system. You can measure the dc control voltage coming out of the PLL (IC-1, pin 5), and tweak the VFO until this control-voltage centers at about 3.5v on Chan-12 (about the middle of the Novice band) although it's not critical. If you plan to operate higher than 28.500 MHz, you might want to center it on a higher channel.
To summarize the theory of this example on the low end of the Novice band: VFO is at 39.000 MHz (1 MHz above CB-chan 30) and mixes with I.F. freq. of 10.695 MHz for a difference of 28.305. For phase control, the 39.000 is also mixed with a 40.210 MHz reference for a difference of 1.210 MHz which requires a div-by-121 to reach 10 KHz. We had to ground pin 8 to avoid a minimum count of 128 (we need 121 or less). We still have fixed divisor of 64 (pin 9 tied HI), so the selector channel needs to supply an additional 57 which it does in Chan-6 position by switching pins 10, 11, 12, 15 HI, and grounding 13 & 14. After these two simple changes, the radio came to life immediately. However since I had the SAMS book with all the pictures to identify components, I went thru and tweaked up the circuits that now operate at higher frequencies. It did as you would expect improve considerably. Those without documentation will need to proceed carefully. The inductors near the RF Power out and its driver should be easy to identify without docs.
Finally, I also mentioned an older 23-Chan Cobra model 135. I have not changed it over yet, but in analyzing the documentation, I feel certain it would be easy to convert by simply replacing quartz crystal X10 (8.409 MHz) with one 9.5 to 9.67 MHz ...a single crystal would provide four operating frequencies. Each new crystal in that range would offer four more operating frequencies. In this model, the sum of two crytals (one from each group) combined with the 7.8 MHz I.F. yields the operating frequency.
Both models have the "clarifier" function in Receive, which shifts operating frequency plus or minus....perhaps filling in most of the gaps in the channels separated by only 10 KHz. If desired, it should be an easy task to modify this same circuit to include shifting the Xmit frequency also.

I FORGOT TO MENTION that on the Midland modification, Chan-21 on the selector yields the High end of the Novice band at 28.495 MHz. The dial limits should be marked clearly, or perhaps a physical-stop on the older dials if only the Novice band is intended.

His Email is LOU@CBCINTL.COM

This will append the previous entry called EASY CB to 10M SSB: This offers another nice option if it is to be used on Novice band only (This applies to the Midland 79-892 model). The PLL-02A IC offers the option of moving in 5 KHz steps, by simply grounding pin #4. In this case, pin #8 does not get changed (stays high as it is originally). We need the higher divide-count to reach the 5 KHz phase reference (double the count required on 10KHz).
The same instructions changing the VFO still apply. In this case, the 28.305 frequency is not available because of the glitch in selector switch which was necessary to accomodate those "20 KHz step" exceptions. The lowest frequency will now be 28.310 which corresponds to Chan-12. (Technically, 28.300 USB on Chan-11 might be permitted, but I would not advise it). The operating frequency moves in 5 KHz steps as the Channel selector is advanced (except for the 2 or 3 glitches where it advances 10 KHz). But there are not enough switch positions to reach the high end of the Novice band so that Chan-40 corresponds to 28.460 MHz. With the smaller 5 KHZ steps, it is almost certain that the clarifier will fill in the gaps with possible exception of the 10 KHz "glitch" channels.
From looking at the schematic it appears to be a simple matter to add a "Delta-Xmit" pot to shift the Xmitting frequency during Xmit only. Replace R-26 (10K) with a 100K pot...using two of its terminals and locate the pot in a convenient location. Run a shielded line to replace R-26. Be sure to verify which end of R-26 is ground. Add a 0.01 ufd across this location. This should work well, because an almost identical circuit is used to place the "receive clarifier" pot remotely in the Hand-mike.
...One small correction in the original article....at one place in the text I mistakenly referred to a Cobra-135. It is model Cobra-138.

Someone ask about a schematic for a Kraco 4060 CB-unit. I don't have info on that model, but I have some notes on Kraco KCB-4020 (AM 40-chan), and KCB-2320B (AM 23-chan). Both use the same PLL-02A IC in the synthesizer system..... i.e. divide-by-n (1 to 512). Exactly the same theory applies as was mentioned in the earlier post (EASY CB-to 10M SSB). The same 10.695 MHz I.F. frequency is used.. the main difference is that the Midland used a reference of 40.210 MHz, while the Kraco's use 40.960 MHz to down-mix the VCO frequency to the 2 or 3 MHz range, suitable for div-by-n (512 to 1) to reach the phase-det ref of 10 KHz.
Again, on the PLL-02A, pins 7 thru 15 (activated when HI) yield divide-by: 512,256,128,64,32,16,8,2,1 in the same respective order. Dividing factor is the sum of all the pin-values which are held HI (+5v).
The 23-chan Kraco only switches 5 lines. The 40-chan Kraco switches 7 lines,

while the Midland 40-chan switches 6 lines.
Incidentally, if you have schematics, you may not see those higher (40.210 or 40.960) indicated...they get their final "doubling" covertly in the VCO-Mixer I.C. The 40.960 is four-times the 10.240 MHz Xtal, which conveniently mixes with the upper I.F. freq of 10.695, to yield 455 KHz which is the 2nd I.F. (used on RECEIVE ONLY). If you want to review the theory that was posted in the earlier "EASY CB-to-10M SSB" post, I can E-mail you the files:
gene@eagle.csl.uiuc.edu

About a year ago I posted some rather detailed instructions and concepts for modifying CB-SSB transceivers for use in the 28.300-28.500 MHz Novice band. (I still have the old files and could e-mail them to anyone interested).
I did not investigate, but one reply also suggested that LOU@CBCINTL.COM sells a book with conversion information.
I took the model I converted (Midland Model 79-892) camping last summer and managed a couple of QSO's on a mobile whip, although conditions were not great. I had converted it so that the XMIT changed in 5 KHz steps (except 2 or 3 places jumped 10 KHz due to the unique allotment in the original CB-channels). BUT with such a weak signal, I found that being able to shift frequency either side of the 5 KHz steps was necessary, so as to get exactly on the frequency of the station being heard. I therefore further modified the trans-ceiver so that the so-called "clarifier" that several models use on "receive only" was connected so as to change BOTH Xmit & Rcv identically. This turned out to be quite simple, at least on my unit. Of course with a little more complication, one could add an additional pot and switch so as to zero a station, while Xmit & Rcv are identical, then throw a toggle-switch to provide RIT (Receive-Incremental-Tune) on receive-only but Iconsidered this over-kill for such a low-power transceiver unit.
I did this by cutting the control-voltage wire to the Xmit-diode/resistor (D-5, R-25 on my model). I transferred the control-voltage wire to the Rcv-diode/resistor (D-4, R-24) to a constant +9v (regulated). This was about 1 volt higher than the original control-voltage, and gave me a little more frequency-deviation, which is accomplished by "pulling" an Xtal-oscillator, (i.e. VXO) which of course has limits. The result, was a frequency shift of 3.5 KHz (+ or - 1.75 KHz). Of course it would have been nice to have a shift of + or - 2.5 KHz, which would fill in the gap completely between the basic 5 KHz steps (on most channels), but I considered it fortunate to get this much shift so simply, and with no complications with the Xtal oscillator.
The above-mentioned diodes (only a single diode D-4 after my modification) provide dc-bias to the varicap (D-3) whose capacitance is included in the Xtal-oscillator's circuit.
With the 10-meter band beginning its slow rise to improving conditions this year, perhaps 5 or 10 watts will enjoy success even without a linear amplifier.
With the FCC's new concern about radiation and power levels, there will certainly be no concern with this power-level!

I should point out that when the 5 KHz option (on the PLL-02A synthesizer) is chosen, you can't quite reach the top of the Novice-band....the highest

on the Chan-40 position is 28.462 MHz with the variable pot at maximum. Also, to remain safe you should use Chan-12 as the lower-limit (28,308.5 with the variable pot at min). Although it might be risky, on Chan-11 you can tune down thru 28,300, to 28,298.5 which of course is illegal.

Thanks for reading this, I've built the reciever side of this project,
but the xtal filter won't produce a narrow bandwidth, is there an
error in the cct diagram or the coil dimentions?

filter is
T50-6 torroid with 27 turns 30 swg tuned with a 5-65pF trimcap as
primary winding. damped with a 10K Resistor

6 turns secondary winding to 2 10Mhz xtals in series.
centre of xtals has a 220pF to ground

T50-6 torroid with 3 turns 30 swg , fed from xtal
and 27 turns 30 swg tuned with 5-65pF trimcap with no damping resistor

should resonate at 10Mhz, but its does'nt appear to be tuning anywhere
that freq..

I'm more familiar with a term "secondary breakdown" in power transistors.
It's an effect when the collector voltage is too high, and the collector
leakage avalanches
into the base, thus turning the transistor fully on in the absence of
significant
base bias. To a first order, it's not a termally-induced event.

Some other failure mechanisms to consider:

Poor sharing of current between parellel pass transistors. The emitter
resistance is to balance the current between trasistors when they have
slightly
different base-voltage characteristics. 0.01 ohms is probably not nearly
enough for 2N3055's.

Instability. Building a stable power supply is difficult, especially
with multiple
paralleled pass transistors, and even more so when an additional drive
transistor
is needed to supply adequate base current to the pass transistors. Do you
know
that the regulator/pass element is stable under the expected load
conditions? Has
the regulator's frequency response been rolled-off adequately to copensate
for
poles causes by the pass element(s)? The frequnecy response (pole location)

moves around a lot with load current and load impedance.

...and these "small lakes" are the least utilized, with vast empty spaces, even on 70 CM. And in demand commercially. Hence, the most vulnerable to being lost.
The HF ham bands are heavily utilized on a world-wide simultaneous-use basis, and provide for non-channelized, unlimited time one-on-one QSO's without using a shared infrastructure like repeaters, and using a small fraction of the bandwidth. They are also the least sought after for commercial use, hence we have actually gained more bands over the years (12, 17, 30 meters).
It is understandable then that many of us consider HF operation an essential (for some of us the only desirable) ham radio spectrum in which to operate.

treynolds@my-deja.com writes:

>I have never made a mod to my FT-50 but the PTT button broke off. I got one
>from Yaesu right away but can anyone tell me how to take the darn radio
>apart?

- Take the battery and antenna off

- Remove the two knobs (they just pull off)

- Move the rubber covers on the DC input jack and mic/phone jack out of
the way, so you can see into the jacks

- Remove the black "nicad battery" sticker on the back of the radio

- You will see a slot in the rear of the radio under the sticker with
two pots and a trimcap on a PC board - don't touch them

- At the ends of this slot are two small screws - turn them several turns
counterclockwise, but not all the way out. Then push on the screws.
The keypad should pop out the front of the radio. Once the keypad
and its gasket are clear, remove the two screws completely.

- At this point the only thing holding the radio in the case is two
small tabs on the metal chassis down near the bottom of the radio
which fit into two notches on the plastic case. Holding the radio
facing you, press on the circuit board through the keypad hole
while spreading the lower rear part of the plastic case slightly with
your fingers. The lower part of the metal radio chassis should push
back and out.

- Slide the radio chassis and out of the case, clearing the knob shafts
and antenna jack.

Now you can replace the rubber PTT boot.

When reassembling the radio, it's best to pull the little rubber
transmit/receive indicator light pipe up out of the case. Then install
the chassis in the case without worrying about alignment of the light
pipe. When the chassis is seated properly, insert the light pipe from
outside the case - it will go to the right place on the circuit board.

This sounds good up to here for an individual transistor.

Current sharing among multiple transistors is a completely different
effect from localized heating and second breakdown in ONE transistor.

Since fets from different lots can have wildly differing threshold
voltages, wouldn't you need MORE emitter ballast with fets?
You'd need at least enough voltage across the ballast resistors to
swamp the worst case difference in threshold voltages. The hogging
fet will heat up and reduce it's current somewhat, but can it do that
enough
to swamp out a couple of volts in threshold difference without getting
reeeeely hot??

What am I missing here?

miker

So no emitter resistors are needed when paralleling multiple

I guess the real question is: Suppose you have a bunch of FETs in parallel
with no emitter resistors, so all are running at the same gate-source
voltage. When they are all operating at substantial current (say 5 A
each), is the differential heating effect combined with positive temperature
coefficient enough to swamp the effect of the individual variation in
the FETs *at high current*. You don't really care what happens at
low current - its OK if only one FET turns on before the others if you're
supplying only an amp or two.

And how different are power FETS from each other if they are all
exactly the same type?

In any case, I'm far from an expert on this - I'm just repeating what
I read in "The Art of Electronics". But its authors do seem to have
a pretty good knowledge of transistor behaviour.

Dave

If you download the data sheet for the 2N3055 or the 2N3773 from Motorola's website you see the SOAR diagram. It does not agree with the conclusions that are being reached in this thread. The second breakdown limits are clearly defined, both for DC conditions and for pulse conditions.

The same way as with a mechanical telegraph rig - the length of time
between the clicks (or taps).

After looking at the comments of others more closely, I must clarify my previous post somewhat.

If the DC collector current is kept below a certain level the max collector to emitter voltage can be used. For currents greater than this the voltage must be derated.

But for the 2N3055 or the 2N3773 at DC in a series regulator the "main" limitation at high current is thermal dissipation, not second breakdown. The SOAR diagrams show this. In "normal operation" in a series regulator Vce does not get close to the second breakdown limits.

For the series regulator the worst problems occur when the DC output is short circuited. Then Vce is maximum. A current limiter plus a voltage foldback circuit will reduce the transistor dissipation to a safe value within the SOAR diagram.

The data sheets also show a small region of V and I where additional second breakdown derating is needed. Internal emitter ballasting of the constituent transistors probably reduces this region.

Also, when choosing a value of transformer voltage, the min and max values of AC line voltage must be considered so that at the min value the regulator is still working. This increases the dissipation somewhat when line voltage is normal. The transistors and heat sink must also be adequate for the max line voltage value. At max line voltage we must still be within the second breakdown and thermal limits of the transistors.

The stability of the series regulator is assured if an open-loop frequency response of -6 dB per octave can be maintained. The corner frequency for this is chosen such that the loop gain reaches unity before some secondary rolloff corner frequency (12 dB per octave) is reached.

An exception to this could occur if the regulated voltage can be turned down to low values, for example if a 28 V, 10 A regulator is turned down to 5 V at 10 A. Second breakdown and/or excessive dissipation might occur. Normally this happens only in adjustable "lab bench" supplies. For radio equipment supplies it would not normally happen. If it did happen accidentally, protection circuits would kick in.

Many lab bench supplies have automatic range switching on the
unregulated DC supply. As the output voltage drops, circuitry changes
secondary taps on the transformer to keep the unregulated supply high
enough for proper regulator operation, but not too much higher. This
avoids the excessive dissipation problem.

There could still be a problem if the output of the supply is shorted
when operating at high voltage. For example, if the supply is operating
at 30 V out with 35-40 V out of the bulk supply and the output is shorted,
for a brief period there is still 40 V on the capacitors and thus 40 V
across the output transistor, at maximum current.

Unfortunately, many devices sold as "2N3055s" are actually out-of-spec
chips that were originally intended as other devices, which happen to
fit the basic 3055 spec and are sold down-market.

Unfortunately they won't necessarily have the same "typical" performance
as the 2N3055 in all respects - especially those directly connected with
internal structure. Also, some of these devices have a higher Ft than a
genuine 3055, which can cause some interesting stability problems.

By the way, this kind of selling down-market is a legitimate industry
practice - not to be confused with the guy in a back-room stamping
"2N3055" on a batch of un-named TO3 cans... although that happens too,
and the 2N3055 is a favorite target.

The current limiting circuitry in the regulator limits the short circuit current. The voltage rating of the transistors must be enough to handle the short circuit voltage. For example, my 40 V 8A supply uses four 2N3773s with a rating of 140 V (the 2N3055 has a 60 V rating and is too marginal). The short circuit current is limited to 4 A and the max Vce is about 53 V. This is well within the SOAR for each transistor. The thermal boundary of the SOAR is also not violated under short circuit conditions.

This power supply is described in the March/April QEX.

Solution: for a critical application, buy authentic Motorola 2N3055 or some other standard brand with a published spec sheet that the mfr guarantees. Also, always apply generous derating factors to accommodate the "typical" data sheet specs. One can also spend an extra dollar and get a better and more modern transistor such the 2N377X types.

The usual "basic" 60 V 2N3055 is OK for 24 V regulators if they are well heat sunk and protected from abuse. I have bought them at Radio Shack, no problem.

For some reason I am reminded of Cary Grant (English?) the famous, long-lived, Hollywood film star who towards the end of his extensive career received a wire (a telegram in the UK) from one of his loving but curious fans. It read "HOW OLD CARY GRANT STOP".

Conscious of maintaining good relations with his world-wide fan clubs he wired an immediate reply. It read "OLD CARY GRANT FINE STOP HOW YOU STOP".

Are baggy underpants still in vogue ?

A 102" whip is 1/4-wave resonant (above a perfect ground) at 28.1 MHz when one allows for an end-effect of 3%. But the end-effect depends on antenna diameter which is neglected in ARRL publications. Makes quite a difference between lattice masts and 18-gage wire on 160m.

Since everybody on your side of the pond quotes from them, out of curiosity a couple of months ago I purchased the two american bibles :- ARRL Handbook and the ARRL Antenna Book. One of the first thing I noticed was One S-unit = 6dB. The amount of excellent info contained between the covers is stupendous.

I'm getting near the end of a bottle of Californian red. Good for the arteries. Must put out the cat. Good night Cec and all other readers.

Howdy, Don:

Long ago I used to lay out my double sided artwork using clear plastic loose-leaf page protectors. I used to use the tape type pads and traces. That way it's easy to see registration thru both sides as you go.

When exposing the treated PC board, I'd tape it between the sheets and expose it. Used to work very well. Kinda low-tech, I know, but never had trouble.

I used to use the old Kodak positive resist, which they no longer make, which was terrific. The Kepro is ok, but very finnicky about it's drying and developing. That Kodak stuff was idiot proof. Used to develop it in a mild lye solution and etch with ferrous sulfate. I haven't done a PCB in a few years, so I'm sure there must be better chemicals and methods by now! Maybe you know of some good positive resist out there??

Good luck & 73,

Can anyone tell me the best way of cutting and preparing this coax for connectors?
At the moment I find the best way is to roll the cable under a sharp razor blade, but find it difficult not to cut into the dielectric, and also it is easy to distort the outer copper.
Possibly tools exist for this but I'm talking about doing a few at home, not thousands in an industrial environment.
Using this cable with standard BNC connectors is another whole thread in itself, but I think I've got that sorted out :-)

Too bad I missed the beginning of this thread.....
FYI: I used 6 102" steel whips spaced .125A to .065A apart and planted on the flat roof of my shack using grounded chickenwire mesh as counterpoise. To my surprise and delight, the array work as well as my 4 element 10m beam. Of course the array refuses to rotate :(
Hames in the Southeast hear my 2.5 watt signal very well with it, so It does work.
See ya
Jim

> Martin McCormick wrote:
==========

A simple charger current limiter is a 12V bulb .
If your charger can do 2 A max (for example) ,put a 20 -25 W car bulb
in series.
Normally the bulb with hardly glow due to small voltage differential
between charger (say 13.8 V) and 12 V battery. But if battery is
veeery low or internally shorted ,you will not blow the charger.
The bulb glowing is also an indication of the battery status while charging.

If you wish to charge faster you can fit a higher power bulb ,say a
50 Watts headlight.
In the event of a battery short a 2 A fuse in the charger circuit
will protect the charger.

> Thanks Tim
It depends on time of the sunspot cycle and the time of day. On 80 meters, there isnt much at all in the daytime, but it is a well used band after sundown. 40 is a good band for day or night, as is 20. When the sunspots are at minimum, 20 meters can be pretty much dead at times, but 40 will usually have something even then. You cant really go wrong with any of the bands, but the antenna will be smaller for the higher frequencies. I dont know how well you copy CW. If you can go at a pretty fast clip, 20 would be ok, but if you are looking for slower speeds, then 80 or 40 would be better as there is novice subbands there.

Don

Generally, 40m at night is lively. 20m is hot 24 hours now, but slows down at night during solar lows. If you're interested in DX, get the 20m; the 40m will pick up good regional ragchews even during daytime. I don't spend any time on 80m, so I can't comment.

Me personally, I'd get both 20m and 40m. For that matter, the few extra dollars for full HF coverage seems a bargain.

Michael.

To what extent have BA designs been duplicated by home constructors? I would be interested to see a commercially manufactured unit and a home built copy perform side by side. You would think they should both perform almost identically (allowing for slight variations in components) if both are in 100% shape. Which BAs have folks duplicated, and with what results?

I've sanded anodized surfaces with fine garnet paper and then dipped them in, or brushed on, a solution of sodium hydroxide (lye) for a few minutes, then rinsed and dried; and have gotten very good adhesion with acrylic, polyurethane and oil based paints. I think vinyl latex paints would stick to such a prepared surface as well.

Interested in Amateur Radio, Electronics, Computers, etc.?

Next weekend, come out to the 1999 FATHERS DAY HAMFEST
Sunday, June 20th 1999

In Historic Frederick, Maryland
At the Frederick County Fairgrounds, 797 East Patrick St.

- Easy access from I-70, I-270, US-40, US-15 etc.
- Plenty of Parking

- ARRL VE Testing (courtesy of MADRA VE Team)
- Testing starts promptly at 09:00

- Large Outdoor Flea Market / Tailgating Area
- Indoor Ham Radio, Electronics, Computer Commercial Vendors
- New and used Ham Radio equipment and accessories - Two
commercial new equipment vendors - Icom, Kenwood, Yaesu etc.

- Good Food and Refreshments (no outside food vendors, please)

- Rain or shine, 08:00 to 15:00 EDT

- Admission: $5.00 per person donation
- Tailgating spaces: $5.00 each + one admission
- Indoor vendor tables: $15.00 each

Talk-in: Call K3ERM on 147.060 (+) K3MAD repeater
146.640 (-) K3ERM repeater
146.520 (x) Simplex

Email to me or to n3vok@erols.com with questions, vendor reservations,
etc. Include fax number for map and/or flyer.

73 and see you there,

It sounds like your power supply is well designed.

My point was simply that it's possible to design a supply where the Vce
of the transistor is normally limited by adjusting the unregulated supply
voltage, and the current is limited by the regulator circuitry, and *still*
get into trouble. This is because the input-voltage adjustment cannot
operate instantaneously, so when the output is suddenly shorted the
output transistor suddenly finds itself operating at maximum current and
near-maximum voltage simultanously. This condition doesn't last long
enough to worry about thermal dissipation, but it might last long enough
to worry about safe operating area limits.

Dave

One of the problems I had when designing a high curren power supply was with the connections to the transistors. You can find transistors that will handle more current than the connections to them will. this is especially tru of some of the high current TO-3 case transistors. I usually try to limit these to about 7 amps per device. 5 amps would be even better.

The "best" way is with a fancy machine that uses a rotary blade where you set the depth so as not to cut into the dielectric.
The easy/bench method is to score the outer sleeve, just as you have been doing, but not to keep going around until you cut thru the sleeve. Just score it then use needlenose pliers to grab the scored end and gently flex it back and forth until the score breaks thru all around. Then pull off the outer sleeve and you're ready to attempt the same on the dielectric! An easier way is to use cheap wire strippers, setting the blades so they don't quite meet, or leaving the inside circle when the blades close just larger than the inner conductor. I've been doing the stripping operation that way for many years at work.

It's not the radiation directly, it's the effect of the radiation on the
ionosphere that disrupts communications. As I recall, HF "skip" propagation
is gonzo for many hours after a nuclear blast, but the effect should clear
up in 24 hours or so and you can go back to DXing... if you still have
a power source.

I don't recall any references offhand but if you really wanted references
instead of just confirmation that the effect exists, e-mail me and I will
see if I can find some.

Wow! This is really getting surrealistic. Even most no-coders know how to send and recognize SOS (That's why they could use it in the show "believably". LA cops AFAIK, don't receive Morse training). Besides that, (a) it was a stupid plot device, (b) Martin Milner still can't act, and (c) TV shows are probably not a really great input to base federal communication policy upon.

I've been looking at all these web pages for home made radio's.
Is it pratical to hand make your own cavities for a VHF-repeater.
Anyone know where to find info for home making one.
Dano

Hello everyone. just a reminder about TDD and I now have a web page up that has the current list of known particiapting stations. If you are going to participate let me know. You dont have to keep score to count. By just setting a few parameters you can help fellow hams rack up point without you even watching. I have included links to my email, the TDD site at TAPR and the list server subscription page.

http://www.dallas.net/~jvpoll/dup6m/dup6m.html has an example of a 6M duplexer that could be scaled to 2M. The July '72 QST has an article "A Homemade Duplexer for 2 Meter Repeaters", and it seems like CQ or 73 had an article in the last few years on building a 2M duplexer from copper pipe.

In any case it seemed like a lot of work for relatively marginal results :-)

Super duty transformer mfg by Osborne transformer in Detroit. 4000 or 5650 Volts center tapped output at 500 mA continuous duty. Rated at 1.98 kVA with 220 or 110 Volt input. Size is approx 9" deep by 7.5 " wide and 10" to insulator tips. I would guess weight at about 50 pounds. It has never been used (to my knowledge) and does not flash over with 160 Volts applied to the 110 Volt inputs in very humid conditions. I was going to build an amplifier with it a few years back but lost interest. Forget about me shipping this behemoth.... pick it up in southeastern Michigan (Detroit) area for $75 or might trade for 300 watt roller inductor antenna tuner.

Hi all,

I've got a Triad TY-84 inverter transformer and now that I'm ready to build it into a power supply naturally I can't find the data sheet (I knew where it was for years, but then I moved and...). If anybody can supply me with this data I'd be very grateful (as well as paying for your postage, time, etc). Thanks.

73,
Mike, KK6GM

Neil,

A few years back QST had an article describing a fet amp
that would suit you needs. I can't remember the issue
however. Maybe someone else can...

Another possibility is: Communications Concepts Inc My
catalog is a bit old, but they have a kit (was $80) for a 2M
amp 1/4 watt to 3 watts in (5 absolute max) that provided
2-35 out (drive dependent). Good for SSB or FM. I don't
think they have a net site. They are in Beavercreek, Ohio.
Phone: (was)
513 426 8600. IO have delt with them in the past - no
problems.

I've had good luck using a small tubing cutter. It does smear the shield some in toward the center of the cable, but not enough to short the center conductor.

If you can deal with 75 Ohm, head to your nearest CATV yard and ask for an end cut. You can cheeos from 5/8" 1" and 1.5" and average lengths are 75-350' depending on your luck.
I have over 500' of 5/8" run here and it feeds a 20M monobander just fine with homebrew matching nets on each end. I have been successful with it up to 144Mhz using 1/4 wave 3/4" copper pipe matching units.
Best Regards
Jim

Gosh,

I've been watching the ads over in the swap groups for a little while.
When did the prices of used stuff get so *high* ?

Can probably make something better than commercial

Can make exactly what you want

Can have lotsa fun

Get to brag

....and now... I changed my mind... you can easily save money

Does anybody really need any more incentive to build their own?

The ARRL Handbook has a great VHF duplexer projext for you. I built one
here using Shedule 20 steel pipe and the thing Isolates as well as any
commercial units I've used. The added bennie is a single antenna.
I was able to "Cheese" together a Mastr series transmitter using an old
ICOM 2m mobile as agile reciever with limited results. I ended up
installing the Icom inside a copper box as it was picking up stray RF.
Good luck on your project.

In my experience, breakdown voltage is also somewhat frequency dependent. Certainly breakdown voltage at RF is markedly lower than at 60 Hz.

You know there's something wrong when you follow-up to your own message. :-)

I neglected to mention the band! It's 2 meters--144 to 148 MHz. Still
looking for that fairly simple circuit I know exists somewhere--anyone
have it?

Hello,

I have designed a repeater controler, but I have no idea how to market
the thing,
It is built on an ISA card and designed to run in a PC 4 full deplex
ports plus 1 recive only and autopatch
anyone have any ideas on ho to start a company or sell the design at
least?
I have a somewhat functional site at
http://www.geocities.com/Area51/Lair/4584/

From Jack:

Yours for the shipping. I have some (9) stainless steel pipette holders - used to contain pipettes when they were autoclaved - they are about 2 3/8" diameter and 14" long with a tight fit cap. Perhaps some VHF/UHF experimenter could use them. I told the XYL not to throw them out about 10 yrs ago, but they have just been collecting dust. They are yours for the shipping from 07078 (maybe you could throw in $5 for the inner city school I do some work for.)

From: Michael Anderson <michaela@qualitau.com>
Message-ID: <7k3bu3$dsu@journal.concentric.net>
Source record: 69376

I'm for a circuit to do an automatic Transmit/Receive switch in a linear amp. I've got a linear amp kit that comes with a pre-amp kit, but no glue circuits to stick the two together. I don't want to modify the HT (2m) or have a second switch on the amp.

I've found some PIN diode switch designs, but they still depend on a DC input signal. I guess if I had a TX/RX detection circuit with a DC output I could glue everything together with that.

Thanks,

Mike KF6LGN

>> Steve AA7U

A sharp razor blade is a heck of a lot cheaper than a $25,000.00 rotary
stripper made by Schleuniger(swiss). Fine piece of equipment but for us a
razor blade does the job.

Another suggestion is to make a simple razor blade fixture with a stop which
when pressing down slightly on the razor blade and rotating the cable it
will score the jacket only to a certain depth (O.D. of insulation). The
outside diameter on the semi-rigid .141 is held if I remember correctly, to
within .002" total.

Just a thought...Good luck

450. Building my own repeater - where to get the filter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-15 00:00:00 UTC
From: mroberds@worldnet.att.net
Message-ID: <7k4ken$4vs$2@bgtnsc02.worldnet.att.net>
Source record: 69294

Hello all!

I've been thinking about what it would take to build my own repeater for VHF (150 Mhz). Parts of it are pretty simple. I basically need a transmitter set to my desired "output" frequency, a receiever on my desired "input" frequency, a connection from the "squelch open" on the receiver to the PTT on the transmitter, audio (with level matching) from the receiver to the transmitter, and possibly tone decoding and encoding. So far so good.

But I also think I need some kind of super-duper filter to keep my transmitter out of my receiver. I have observed that even with very nice 2M transceivers, you can hear a commercial 150 Mhz radio (with an antenna near the 2M antenna) through the 2M set when the commercial radio is transmitting. Basically I want it to pass my receive frequency but roll off sharply for the transmit frequency. I can run two different antennae, if need be, so I don't have to worry about combining the transmit and receive signals into one co-ax. But I do have to keep the transmitted RF out of the receiver.

Can anyone point me to a source of such sharp filters? Or is it cost-effective to make your own? If so, are there any articles or books you could point me at? Or is this the wrong approach entirely?

Thanks very much for your help!

454. Help: Philips (?) Snyth Chip TDD1742T

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-15 00:00:00 UTC
From: rjburden@bigpond.com
Message-ID: <37663585.999254@news.bigpond.com>
Source record: 69298

Hi all,

thanks in advance for taking the time to help. I have a couple of
boards I acquired at a recent Hamfest that were part of an anolgue
mobile phone base station. The synthesizer chip looks interesting:

marked TDD1742T
Appears to be the Philips logo on chip, but is smudged making this
uncertain
looks like a parallel load

Philips carry no data on their web site...any ideas where I should go
looking for data?

Thanks again,

Richard

Just takes a simple circuit of one 2N2905a transistor and a relay.
Otherwise Ramsey Electronics sells one in a small kit.

I currently use a FT-50 HT along with a 2 m linear amp at home. I have a 2 m quad and a 70 cm yagi up the tower. I mainly use my HT in the ham bands but I also use it to listen to the emergency frequencies in my area.

As a firefighter, I like to stay on top of the situation so I monitor the surounding department's frequencies. Unfortunately, many of them are on the UHF band and I must switch coax to use the yagi or else I get a very faint signal. Also, on occasionsI have forgotten to switch coax and have transmitted in UHF through the linear while it was on. Nothing bad has happened yet but I don't want this to happen to often...

I have built many antennas in the 2 years I have been a amateur radio operator and now I'd like to try something else. I am in need of a duplexer so that I can have the 2 beams plugged into the HT at the same time to listen to frequencies on both bands without having to switch coax. My budget is kinda tight so I was wondering if there is a way to homebrew a duplexer.

What I need is a duplexer that will let the following frequencies into the HT:

130 to 174 MHz
400 to 470 MHz

I hope someone can help me with this as I really need that duplexer.

I have a MFJ-969 300W roller tuner that I am just getting around to using after having it a good while, and out of curiosity opened it up tonight to have a look at the circuit. Everything is there that should be and assembly is a bit more solid than I had expected given the less than Millen/Drake/Collins reputation that MFJ has.

However, some of the parts MFJ uses could be a *lot* better, notably the balun and the binding posts/wire & balanced line feed-thrus. I would like to replace the balun with a beefier one. The OEM balun is a only about 1 1/8" O.D. x 1/2" thick, wound with 22 AWG (estimated) hook-up wire. I plan to use this tuner with 450 ohm window-line and no more than 200W, but I don't trust the MFJ-provided balun, so I want to wind a heftier one and put it in there in its place. What core size/type & wire size/number of turns should I use for best results?

I am also thinking I could extend the tuner's safe (for me *and* my transmitters) operating range down to >50W on 160M (using either my 66', 18 AWG dipole or 132', 14 AWG loop) by clipping HV mica transmitting caps in parallel with each of the two variables, and also a HV switch to toggle them in and out as needed. Will this be an effective way to allow safe operation on the low bands at moderate power? What exact type of fixed caps should I use for this application, and about what values? Doesn't the Nye--Viking transmatch have a similar arrangement where fixed caps are switched in or out in parallel with the air-variables for certain bands?

What experience have others had making similar mods to tuners? What other "optimizing" mods of no more than moderate cost and complexity should I consider?

I have more than a dozen air-variable caps with no markings as to capacitance or working/puncture voltage, or indeed any markings at all. I know the formula for calculating capacitance from dimensions of the plates, but don't have a clue how to figure out breakdown voltage. Of course, plate spacing is the central variable (NPI), but going off the plate spacing alone isn't good for more than a guestimate. Is there an equation for this? Let me know, or let me know where to go {and look :)}. Thanks.

OK, thanks. Now, how to measure plate spacing: is it plate to plate on the
rotor, stator, or between rotor and stator plate?

OK, I am learning a bit from this thread, and archiving the posts for more thorough digestion later as I am intellectually able. For the moment, can Cecil, Richard, or other interested parties recommend what to do about the rinky-doink balun in my tuner? I want to use the tuner with a 132' horizontal loop for 40-10 (and some low power work on 80CW) and want the best setup (without buying any new major pieces of gear) given what I have on hand. How would I use one of those W2DU ferrite bead choke-baluns since I have no coax in my antenna system? Or is there a version to use with window-line and in place of the MFJ little balun-oreo?

Will, the short answer to your last question is that you would terminate
your ladder line at one end of the W2DU balun and then run coax from the
other end to one of the coax connectors on the back of your tuner. Forget
about the built-in balun. The tuner then operates in its native
'single-ended' or unbalanced mode as it was designed to do. And probably
does a better job than when attempting to handle ladder line with that
"rinky-doink (?) balun." ;^)

Well, the Altec Voice of the Theater speaker system uses a horn
tweeter that has a very high efficiency, but it is also too expensive
for a xtal set. Seriously, tho it's going to be hard to get high
efficiency in any speaker. You would be better off using a headphone,
which can give good volume with a few milliwatts.

I'm looking for a low power electrical generator.
It needs to be mechanical, not solar. I'm only
looking for about 100 watts (12-15 VDC at 5-10 A).

I thought about extracting the generator from a
hand-cranked flashlight or radio, but their power
output is too low.

The commercial units I've located so far are much
too big and expensive for this homebrew project.

Can anyone suggest a supplier?

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 20th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

Yes, fine. Except that 613-9384-1951 is formatted like a USA number.
The international standard formatting would be +61 3 9384-1951. The
plus tells you it is a country access code and the area code is seperated
out so you know how to dial locally.

It would depend on how much phase noise the transmitter has and what power
it's running.
My guess is you MUST have an anti-resonant element in the band-pass cavities
to notch out the other
frequency. (Making them duplexers...)

I've had lots of experience along those lines and for non-resonant
length dipoles, I wouldn't use anything but a W2DU 1:1 choke/balun
as described on my web page. Multiturn Toroidal Transmission Line
Transformers are designed to work into their designed-for load and
do not tolerate large deviations from that load value very well.

Hi Cecil,

OK, I will have a look at the design you mention. Do toroidal baluns deal with non-resonant loops any better than non-resonant dipoles? A point of some interest for me is how one can determine the designed-for input and output of conventional baluns?

I don't for a moment dispute that you are correct in what you say about them not working well when their load varies much from the design value, though I wonder how tuner and balun mass-manufacturers "get away" with selling products that they *know* that their customers in fact buy just because they expect that these devices *will* indeed function well over a wide range of load conditions?

SWR and Zï¿½ are all that matter at the transmitter end so I doubt it.

> A point of some
> interest for me is how one can determine the designed-for input and output of
> conventional baluns?

The ratio number implies the designed-for impedance. Unless otherwise specified
the primary impedance is 50 ohms. Thus for a 1:1 balun, the secondary
impedance is 50 ohms, 200 ohms for a 4:1, 300 ohms for a 6:1, and 450 ohms
for a 9:1

The tuner manufacturers may not be aware of that, Will. The great majority
of their customers never use those dinky built-in baluns. Those who do
often give up on that configuration without ever notifying the tuner
manufacturer of any problem.

Spiker OM (Callsign?),

I have not been impressed with many of MFJ's products. I am sure you can find a more cost-effective rig solution. you can make contacts using just about anything. Check NorCal and other QRP web sites for homebrew proven QRP designs.
Does it have to be QRP? Many multiband 100W rigs are available on the used market for equal or less cost than factory built new low-power rigs. You can always run 10W or less with these rigs too, if you want, but you have higher power available when needed, and 160-10M coverage. I can recommend the TS120S, TS130S, TS520/530/820/830(S) from first-hand experience with them. And, the 5xx and 8xx rigs all have built-in AC power supplies and pi-network outputs that will drive reasonable antenna loads with no tuner. These rigs are available at $300 and up, depending on exact condition, etc. They are rugged, REPAIRABLE rigs, and will probably be worth the same if you decide to sell later on.

Hi Cecil,Will,

Much of what Cecil has to say has practical value. When getting into
the "design" of the Baluns, however, there is a shortfall of
discussion when it comes to this "ratio number."

This number is a short-hand expression. To say you have a 4:1 Balun
is not saying enough; because it could be a 1:4 Balun instead! Please
note that this ratio has nothing to do with turns count.

4:1 - 1:4? I'm sure this goes right over many reader's heads because
the first thought that comes to mind with Baluns is that they operate
like standard 60 Hz power transformers. Baluns do not operate like
these transformers and consequently the "ratio number" is not like a
windings ratio.

I will provide an example of this confusion of "ratio number." Let us consider a 4:1 Balun designed to provide service between a 50 Ohm source and a 200 Ohm load where, perhaps, it would be more natural to call this Balun a 1:4. Ah! now I have introduced load and source specifications and found that the expression of the ratio works to drive the naming convention of the Balun to 1:4. As this is a standard available item for amateur use one may forgive and forget this distinction.

Having allowed the distinction to lapse, the unwary amateur may suspect that he could use this same, common device for other applications. A tempting one could be for that short vertical that only presents 12.5 Ohms. 12.5 Ohms is to 50 Ohms as 50 Ohms is to 200 Ohms - not so? That is, a 1:4 will always work as a 1:4 (or 4:1 for that matter) should it not?

The short and long answers are NO.

Again this is not about windings ratios. The commonly available 1:4 Balun works between Z's of 50 Ohms and 200 Ohms. It is NOT designed to work between Z's of 12.5 Ohms and 50 Ohms (nor 100 Ohms and 400 Ohms). It may be forced into such service, and it may function in such service; however, it may as easily fail in such service if you are unaware of the limitations presented by such miss-application. These limitations will emerge rapidly at the "band" edges for this miss-applied device.

Baluns are very efficient transformers within a well characterized frequency range. The alternatives to common 1:4 Baluns I see for sale often come in 160 M versions which is to say that the common design just about covers 80 M but runs out of gas at lower frequencies. The same could be said for the upper end of HF, but I have seen no high HF variants for sale. Most designs I see have an insertion loss of less than 0.1 dB over a decade of frequency range. Outside of these band limits and the insertion loss climbs extremely fast.

There are also variations in design as to toroid or rod implementations. There are also variations in material used in the rod or toroid. By and large the best designs (most efficient and widest frequency range - both) come from ferrite toroid followed by ferrite rod followed by powered iron toroid. The ferrite toroid can present less than 0.1 dB insertion loss from 500 kHz to 20 MHz. The ferrite rod can present less than 0.1 dB loss from 1 MHz to 18 MHz. The powdered-iron toroid will present less than 0.1 dB loss from 3 MHz to 15 MHz. If one were to replace a ferrite toroid in 160 M service with an iron-powder toroid, the insertion loss would climb from 0.1 dB to 0.6 dB. This last suggests a 6 fold increase of loss for a simple, naive substitution. With 100 W, this substitute Balun is going to have to dissipate 6 W, or fail.

Of course, most of the numbers above is so much pencil whipping as there are variants in design to answer every objection. However, almost none of these considerations are presented along with

advertising copy. Thus the marketplace gives the impression one size fits all (t'ain't so). There are frequent contributions to this newsgroup of the experiences of exploding, flaming Baluns attended with mumblings of core saturation and such. The experience (less the mumbled explanations) is evidence of the margins being exceeded much in the manner I describe above.

This takes us back to Will's original question of how is one to assess the quality of any particular Balun? How is one to assess its characteristics? The insertion loss of the already provided Balun can be guesstimated by the amount of heat produced in service.

Will's impression of applicability of the current Balun and winding his own can only be guided by impressions. Unfortunately I suspect such impressions are driven by considerations usually observed only for 60 Hz power transformers. What impels me to make this statement is the discussion of wire size and turns. The proper consideration is for the winding's transmission line Z and its ends' isolation.

That is, the windings consist not of individual wires (like the primary or secondary of a power transformer), but of wound transmission lines (wire pairs). Yes, those wires wound through the core are a transmission line with a characteristic Z. The number of turns of that transmission line relate to isolating the input of the transmission line from its own output. For high frequency operation, it is well to keep this transmission line short (and thus fewer turns); for low frequency operation it is well to keep the number of turns high. As you can see, such imperatives are counter-influencing. A solution to this enigma is found in using a smaller core. This raises the stakes though when marginal operation forces this core to sustain higher power loss.

This aspect of the windings being transmission lines rather than individual wires is the least discussed/understood topic in this forum. To achieve proper operation (most efficient operation), the Z of the wound transmission line (like that of the 1/4 wave transmission line transformer) should be equal to the square root of the product of the two Z's being matched. As an example for the 1:4 Balun operating between a Z of 50 Ohms and 200 Ohms; that wound transmission line should exhibit a characteristic Z of 100 Ohms. If we had a 1:4 Balun that matched from 12.5 Ohms to 50 Ohms; then that Balun would be wound with transmission line of characteristic Z of 25 Ohms. As you will note, the same "ratio" but different construction requirements for different service requirements. Again, more pencil whipping (my simple assertion does not strictly hold for 1:4), but the substance of the point is well illustrated by this.

There is a world of other technical consideration (as long as you want wide bandwidth for low insertion loss). If you take care to follow models provided by authors that discuss issues of Load and Source Z, establishing the winding's transmission line Z, and the trade-offs of how many turns; then you may construct these and feel reasonably

assured of their performance. I am afraid that the state of the art for much Balun design in casual articles descends to the level of scribblings on a box-top of cereal. Fortunately, even poor designs tend to work - somewhere, sometimes.

Barring obvious losses (AKA heat) from an existing design, there is probably no reason to replace the MFJ Balun. It is probably not the best design, but without knowing the requirements, any attempts to replace it will not necessarily lead to an improvement.

As a final touch: Will, you mentioned you intend to move toward using 450 Ohm transmission line. This will require a 1:9 Balun, not a 1:4 (much less 4:1); however, I suspect even this would not improve your system requirements (as I doubt that this line will be terminated in 450 Ohms). As you can see, there are many issues that go beyond the one device.

Hi Cecil,

Much is better than all (who would believe a statment containing such
an absolute?).

Your last point is well taken, perhaps we should call it a 1:4:1 Balun
;-) Or perhaps this is yet another attempt to haul out the necessary
correlative of the source exhibiting an R for the Balun to work? Lest
we get into that side-thread (yet again)....

> frequency. (Making them duplexers...)

Dano,
Tom is correct. There are two considerations for a duplexer (or
whatever you want to call it)

1) Keep Tx power out of the RX. This requires something to stop Tx
carrier energy from getting to the Rx. It doesn't pass the TX freq. This
can be a band pass (cavity) tuned to the RX freq in the Rx leg which is
narrow enough to block the Tx freq. Or it can be a notch at the Tx freq.
in the Rx leg. (hope I got that right)

2) Keep TX sideband noise out of the RX. This requires something which
stops the RX freq (YES RX FREQ) in the Tx leg. It can be a band pass
cavity in the TX leg tuned to the TX freq - and narrow enough to block the
sideband noise comming from the TX whixh is on the RX freq. OR a notch
in the TX leg tuned to the RX freq.

There are some Motorola cavities for 450MHz which are band pass, but with
a little coupling from in to out put you can also get a notch at the
companion frequency. So you can get both types in one pair of filters

The double band pass version tends to get called duplexers This is what's
in current car phones) and the dual notch versions tend to be
called...gee, I forgot, but they have a different term (here inside
Motorola anyway)....A rose by any other name still can kill a receiver.
THis type was in an older car phone by Motorola for 450 called the "MK".

Here's my response to a post a little further down the list:

There are two considerations for a duplexer (or
whatever you want to call it)

1) Keep Tx power out of the RX. This requires something to stop Tx
carrier energy from getting to the Rx. It doesn't pass the TX freq. This
can be a band pass (cavity) tuned to the RX freq in the Rx leg which is
narrow enough to block the Tx freq. Or it can be a notch at the Tx freq.
in the Rx leg. (hope I got that right)

2) Keep TX sideband noise out of the RX. This requires something which
stops the RX freq (YES RX FREQ) in the Tx leg. It can be a band pass
cavity in the TX leg tuned to the TX freq - and narrow enough to block the
sideband noise comming from the TX whixh is on the RX freq. OR a notch
in the TX leg tuned to the RX freq.

There are some Motorola cavities for 450MHz which are band pass, but with
a little coupling from in to out put you can also get a notch at the
companion frequency. So you can get both types in one pair of filters

The double band pass version tends to get called duplexers This is what's
in current car phones) and the dual notch versions tend to be
called...gee, I forgot, but they have a different term (here inside
Motorola anyway)....A rose by any other name still can kill a receiver.
THis type was in an older car phone by Motorola for 450 called the "MK".

You can make these things, but they have to be very well made. Drift from
temperatute changes can easily kill the notch type. The single narrow
bandpass cavity ain't much better.

Use the unbalanced output of your tuner into a W2DU choke then into
your ladder line. The W2DU choke replaces the balun in your tuner. I
have the mother of all chokes. Twenty-five #77 1/2" ID cores with four
turns of RG-400 looped through all of them. High voltage/super-high-
resistance is what one needs for a non-resonant system where the
impedance looking into the transmission line is unknown. If you are
unlucky enough to try to push power into a 5K "load" you need ~50K
of resistance/inductance in the choke.

>central variable (NPI), but going off the plate spacing alone
>isn't good for more than a guestimate. Is there an equation for
>this? Let me know, or let me know where to go {and look :)}.

The following table was listed in Bill Orr's "Radio Handbook." This is rotor plate to stator plate (air gap) spacing. In plotting the numbers, some curvature was noted. I fit a curve to the data and found a modified power-law model to fit best. The curve flattens for higher voltages and is around 30 KV for 1 inch spacing as someone else noted.

The fitted equation is:

BV = 27100 * (SP)**0.78 - 641

where: BV = breakdown voltage, volts
SP = air gap spacing, inches

This equation predicts (incorrectly) that the breakdown voltage is zero at a little over 0.0082 inches. Thus you should only use this equation for spacings of 0.03 or higher.

The tabular data is:

Air Gap, inch Breakdown Voltage
0.03 1000
0.05 2000
0.07 3000
0.10 4000
0.125 4500
0.15 5200
0.17 6000
0.20 7500
0.25 9000
0.35 11000
0.50 15000
0.70 20000

Don't forget that the rotor may not be exactly in the centre of the stator plates, and it may not even be parallel with them. Check the gaps with a feeler gauge with the plates fully, and part meshed.

Dirt can reduce the gap too and reduce the voltage rating.

And use a safety factor on the applied voltage if this is necessary.

Cross-posted to: sci.electronics.equipment,Rec.radio.amateur.homebrew,Rec.radio.amateur,Rec.radio.amateur.boatanchors

I picked up a TEK RM-45A 33MHz dual trace scope at a surplus supplier that appears to work. I have a trace, calibrator signal, and get and wiggle traces attaching my RF generator leads to the scope input and varying the signal frrequency and level. I have a manual copy on order, and need a pair of 33MHz or greater probes to get started calibrating, setting up, and using the old TEK.

This is my first scope, though I have been working on tube gear without a scope for several years, and would basically like to use this scope to learn scope fundamentals, improve and speed up my homebrewing and repair (almost all tube based work at low HF), and just to play. So I won't need the best probes at first, and I would like to see how homebrew probes compare with commercial ones.

I need info: parts & materials list, construction method and caveats, schematic, and possibly drawings, on how to do this. Sources? Advice? Comments? Thanks much.

Back in the early 70's, 73 Magazine published a construction article on the "Tiny Tim" amplifier. It used a pair of 811A's mounted sideways in a grounded grid configuration. Nice, low profile design physically similar to Heath's Compact Kilowatt amplifier.

Several of my friends and I built a few of these with excellent results. It may be worth looking through some old 73's in a library.

Mine is on loan to a friend and is still in regular use.

>place of the MFJ little balun-oreo?

Dear Will,

Here's an obvious solution that requires only a small amount of
re-wiring and re-winding. It was written up by A Roehm, W2OBJ, but I
don't know where it was publilshed. I'm sure he would make a copy
available to you upon request.

He uses a tuner, like yours, but lets it float (don't ground it) and
has the ladder line going across the terminals for random or long wire
and the chassis terminal. In other words, the T-match tuner is used as
a balanced tuner even though it is designed as an unbalanced tuner.

Having done that, the Balun is now placed at the coax line from the
tuner to the transmitter. There are different ways to implement that -
one is to use the W2DU balun, and another is to take the 4:1 balun out
of the T-match circuit, re-wind it as a 1:1 current balun (voltage
balun is acceptable but current preferred), and re-install it in a
separate box between the coax to the transmitter and the SO-239 on the
back panel of the tuner.

It's going to be a little tricky with that latter method to keep the
tuner chassis floating, and that's why the W2DUU choke balun is the
preferred way to do it.

Otherwise, you have to put a real short pigtail coax with a PL-259 on
it to mate with the back panel of the tuner, and the other end of that
pigtail goes into the little black box with the balun in it, to
connect to the balanced output leads of the balun. I don't like that -
it's too much of a kludge, but schematically, it looks OK.

The reason that I do not like these other suggestions which place the
balun between the T-match tuner and the ladder line is that it
requires the balun to work into a wide range of impedances, which is

the very reason why baluns don't work as you expect. If you use the balun at the transmitter side of the tuner, you have adusted the tuner for a 50 ohm impedance presented to the balun. That means that the balun ALWAYS OPERATES AT ITS DESIGN VALUE.

In fact, if the balun is a 4:1 balun, and your tuner can transform the impedance seen lookin into the ladder line into a 200 ohm impedance at its input terminals, then you could stick with the 4:1 balun rather than re-winding it.

Last but not least, DO NOT USE THE BUILT IN SWR METER, if you are going to use the tuner as a floating tuner. It will no longer give you meaningful indications. You MUST put a conventional SWR indicator into the coax at the transmitter output. If your transmitter has a built-in SWR meter, that's fine - use that.

THAT'S IT!!
NO SPAM - You are a genius! You have just given me a terrific idea! I have an old horn tweeter with a blown voice coil!!!!!
I will cut the horn off, (it is NOT altec lansing, just a cheap knock off, but it has an exponential horn - plastic) and mount it over the .1 watt speaker I have for the xtal set. I am also using the one transistor amplifier powered by another L/C diode circuit to provide a tiny bit of of amplification of the detected audio signal from the Xtal set - you may have seen that in a previous post. The amplifier plus the horn just could get me what I am trying to get - a little xtal radio that I can set up in the corner to play low level but audible (without an earphone) audio without any batteries.

I reviewed that paper for Al -- it's "Some Additional Aspects of the Balun Problem", in the _ARRL Antenna Compendium_, Vol. 2, and at the time agreed that it was a good idea. Since then, I've become convinced that putting the balun ahead of the tuner doesn't improve its operation at all. I wrote up why I reached this conclusion and put it on my ftp space as ibalun.txt, and a shortened version as ibalbrf.txt. You can download it from ftp.teleport.com/pub/vendors/w7el.

Have a look on the Siliconix web site for AN104,
http://www.siliconix.com/www/data/appnote/70597.pdf, which has at least
the J310. Try the Motorola site for the MPF102...mabye National for the
2N3819? Web sites are your friends...

Sorry, I don't reply directly...too much bounced email. Hope you come
back here to look for replies.

Cheers,
Tom

(With apologies beforehand to my dear friend Barry...)

Gee, if instead of breakdown voltage it was safe working voltage, then perhaps zero would be right for 0.0082"! Breathe on it very hard and it just _might_ short out! ;-)

(Actually, some of the piston trimmers I have may have a spacing about that tight, and are indeed rated for more than zero volts, but not much more!)

Cheers,
Tom

I must not be understanding what you mean, Cecil, because common mode
currents would inherently be common mode up to the point where they
hit the balun - at which point they should be stopped, or impeded by
the balun. The fact that the balun is on the South side of the tuner
rather than the North side of the tuner should not matter. Unless I'm
missing the meaning of your question. Tom Rauch had little or nothing
to say on this newsgroup for about 2 years other than a brief
interchange about 4 months ago. I don't know that I remember the
particualr discussion to which you are referring.

Leland OM,

The above reference you supplied, [http://www.svetlana.com/docs/TechBulletins/technoteNO.34.html] is an excellent example of how one goes about designing and building homebrew gear. For all those many posts I see on here requesting "plans" for building this or that, I recommend they read EA3ALB's thoughtful example of how to go about it. His methodology applies to most any kind of ham homebrewing.

>Didn't Tom, W8JI, once prove that the common mode currents were the
>same on either side of the tuner used in that configuration?

I went to Roy's FTP site and looked at both of the articles. I now
remember reading them at the time they were originally published.

Nonetheless, I am struggling to get a good comprehension of the
meaning of it all, and I hope I am not missing something, but here
goes.

1) I understand from Roy's analysis that the "common mode" impedance
of the balun is the same regardless of the position that it has in the
circuit. That is no surprise. When you move a given impedance to
different locations in a series circuit, it has the same current
flowing through it and it has the same voltage across it - so, no
surprises there.

2) I also see from his analysis that the differential mode signals are
essentially not discussed. The implication being that everything works
the way you would expect it to work, without any surprises, and
without regard to whether the Balun is at the input of the tuner or
after the tuner. Again, no surprises there.

My conclusion is that the Balun works just as well, or just as poorly,
regardless of location. so, where's the problem there? I don't see a
problem.

Now, we come to the question of how well the balun works in its
differential mode. I maintain, as I said in my original post, that the
Balun works FAR BETTER at the input to the tuner than when it is
placed at the output. I say that because of one salient point that no
one has either acknowledged or refuted, and that is that at the tuner
input the balun sees the designed for impedance - namely, 50 + j0
ohms. That fact and that fact alone is the bais for locating the balun
at the input of the tuner.

Not to be a name dropper, but Dick Measures discovered this a long
time ago when he designed his balanced tuner as published in the Feb
1990 QST. In his description of the rationale for designing the tuner
with the balun at the input, he cites the problems inherent in
designing baluns for high impedances, such as may be found at the
output of the tuner. For example, if the tuner is working into a 450
or 600 ohm balanced line, the impedance seen looking into that line

might very well be very high impedances (they might also be very low impedances).

In my opinion, he and Al Roehm are both promoting the balun at the input to the tuner for a variety of reasons, including better performance when operating a given antenna on multiple bands, but they are not emphasizing the fact that the balun that is designed as a 1:1 balun for 50 ohm lines is going to do a better job in the differential mode if it sees a 50 ohm load. Granted, this does nothing one way or the other for its common mode rejection capability. That is a function of other aspects of its characteristics and the characteristics of the antenna system.

For example, if the antenna system reduces to a simple series circuit for common mode with a very small magnitude common mode current at the balun location, then a balun with a low common mode impedance is going to do damn little to impede the common mode current. On the other hand, if the antenna system reduces to a simple series circuit for common mode with a very large magnitude common mode current at the balun location, then a balun with a moderal comm\mon mode impedance can be quite helpful. Either way, however, the differential mode behaviour of the balun is also important from the standpoint of efficiency, impedance transformation and heating. And in the differential mode, it is far better for it to be working into its proper design impedance instead of some off the wall impedance that it would see at the tuner output.

Let's see if I can remember the logic. The balun/choke passes
differential currents and opposes common mode currents. The
differential impedance has little to do with the common mode
impedance. So saying that a balun on the input of the tuner
always sees 50 ohms is not the whole story. It may see 50 ohms
as far as differential currents go, but the impedance seen by
the common mode currents is not changed by moving the choke from
the output to the input of the tuner. Sound right? I think Roy,
W7EL, was also involved in that discussion. I gathered from
that discussion that moving the balun from the output of the
tuner to the input of the tuner is a somewhat futile gesture.

You can order the MAR amps in small quantities directly from
Mini-Circuits (http://www.minicircuits.com). They have a nifty
designers' kit that includes an assortment of the more useful parts. I
believe http://www.shfmicro.com also sells them (although they're
somewhat less convenient to do business with since they don't take
credit cards).

Currents can't be "stopped" at a particular point without violating Kirchoff's Current law which states that the sum of all currents entering (or leaving) a node have to sum to zero. The balun inserts a common-mode impedance at a point in the line, which inhibits common-mode current within a sizeable fraction of a wavelength of each side of the balun.

I don't remember the discussion specifically, but it was some comments Tom made to the effect that putting a balun at a tuner input wouldn't help that made me re-think the issue and ultimately to agree with him.

: looking for about 100 watts (12-15 VDC at 5-10 A).

I hope you're not planning on a person-powered generator -- like
a bicycle or the such...

An *old* automotive generator _might_ do the trick if you are
not otherwise employing a battery. It would be VERY inefficient,
though. You have to push 150 watts of mechanical power into it
to get maybe 75 watts out.

If you're employing a storage battery, then an automotive
alternator would be more efficient.

(Sounds like you do Field Day planning like we do -- two weeks
or less before The Day. :-)

> at the input of the tuner.

An ideal 1:1 "current" or "choke" balun doesn't have any effect on the differential mode current at all, so doesn't "work" well, poorly, or any other way with the differential currents. In practice, to run both conductors of an open wire or other twinlead line through a balun requires putting them closer together for the distance of the winding. This causes a change in the characteristic impedance for a short distance. This doesn't occur with a 1:1 balun made with coax, which has virtually no effect at all on the differential mode current (which is inside the coax). However, twinlead lines are seldom run flat (1:1 SWR), so the impedance "bump" is generally unimportant. The cost of putting the balun at the input of a tuner is that the tuner case is at an elevated RF potential, so it has to be protected from touching.

An impedance-transforming (e.g., 4:1) balun is a somewhat different animal, because it's a transformer as well as a balun. This requires that an impedance (a winding) has to be connected between the two conductors. Improper design of this kind of balun can indeed have a detrimental effect on the differential mode currents, and it does "work" with differential mode currents in that it transforms them. I haven't seen anyone propose that this kind of balun be placed at the input of the tuner, however.

. . .

If you do a Deja search (www.deja.com), you will find postings
regarding that very idea. In the research I did, altenrators are
terribly inefficient and require a battery. Get a real "generator"
and mate it with an engine. It is more efficient and does not
require a working battery.

If you are bent on an alternator, I have one I can sell...
I got it thinking the same thing and the project never reached f
ruition.

Hello,
If you can find a C-Band satellite dealer in your are,
the small motors used in the positioner (arm) are
permanent magnet DC motors. They make great
generators. I saw one made by a friend, used a
weed-eater engine on a small stand direct coupled
to the little "generator" worked great! Output depends
on load and engine speed. Used ones of these
are usually free for the asking with most C-Band
dealers, as the hardly ever go bad. In our area,
It is usually the rest of the arm that goes bad.

Hi Roy,

There are several problems with your comments above.
> In practice, to run both

>conductors of an open wire or other twinlead line through a balun
>requires putting them closer together for the distance of the winding.
>This causes a change in the characteristic impedance for a short
>distance.
This is certainly a possibility, but not a failure of design. That is, the short run of a transmission line through a Balun should be constructed to meet the requirements of the match. What you suggest above is that what passes through the Balun as winding is an ad-hoc construction performed with no particular insight. This can certainly be true of amateur efforts (and probably of some "professional" construction techniques); but this unfortunate failure to observe the requirements does not negate them. Absolutely every construction illustrated by Sevick pays close attention to this matter. Some of his models employ twin-lead - well illustrated on the back cover of his book. For that particular illustrated model of a 1:9 Balun, he uses 300 Ohm line to match 67 Ohms to 600 Ohms. As 300 Ohm line is inappropriate to the match, it is well to note in his commentary the discussion of how the proximity of the line to itself lowers the transmission line Z to 200 Ohms. This is in fact a boon to the design as the requirement calls for this same 200 Ohm line (SQRT(67 * 600)). Thus employing existing twinlead (ad-hoc design) can present the required change in characteristic impedance needed for the Balun operation of matching two Z's (but Sevick performed this by design - not by luck). Far from presenting an impedance bump, it is serving by design in the necessary transition phase of going from 67 Ohms to 600 Ohms. For the case of a 1:9 Balun designed to match 50 Ohms to 450 Ohms, Sevick builds his own twin lead to suit the occasion. For the lengths of transmission line here, this is not a herculean task.

Again with:
>An impedance-transforming (e.g., 4:1) balun is a somewhat different
>animal, because it's a transformer as well as a balun. This requires
>that an impedance (a winding) has to be connected between the two
>conductors.
This is a very troubling statement in that it describes a condition rather haphazardly (it is true for a DC analysis, but is far different in an AC analysis). It is also a non-sequitar (that is, there is nothing that follows from this statement). To say that something connected across the lines:
>Improper design of this kind of balun can indeed have a
>detrimental effect on the differential mode currents,
is much like the old saw of the mail-lotteries "You may already be a winner!" Certainly if an amateur/professional fails to consider the requirements for Balun construction, it may well upset differential mode currents. Again, the fact that many fail to observe these requirements do not negate them.

From the AC analysis, if one is to allow this isolation (and it is the point of Balun construction and application), the combination of reactances and resistances overwhelm this supposed perturbation of differential currents (Cecil illustrated this very clearly several

postings back). In such an analysis (and literally so in Cecil's design), there are no windings across any lines for the Guanella designs. The Ruthroff model on the other hand does present some problematic connections (which I believe even Ruthroff has admitted were unnecessary).

The distinctions between the two models, Guanella and Ruthroff, are not simply those of style, but rather engineering. The Guanella model is more robust and certainly easier to examine/analyze. What is more, I get the distinct impression you had a Ruthroff design in front of you when you penned that all Balun transformers "require"
>that an impedance (a winding) has to be connected between the two
>conductors.
Needless to say, I have little pity for the failures observed in implementations of Ruthroff designs. Pick a poor example and you are sure to find poor performance. However, even a Ruthroff model will perform, somewhere - sometimes.

If you place a balun between two dissimilar impedances, and if you don't have any means of adjusting the match, then a winding with impedance equal to the square root of the product of the impedances will give the maximum bandwidth. (The improvement becomes greater as the winding length becomes a greater fraction of a wavelength.) As far as I know, this is the only benefit of using that particular characterisitic impedance for the balun winding. A particular winding impedance would be important only if you have a matched load on many bands and have no way to adjust for a slight mismatch, or perhaps are using a balun at a high

enough frequency that the winding length becomes an appreciable part of a wavelength. There's certainly no harm in making your own transmission line of the "correct" impedance. But it frequently won't make any noticeable difference, and won't impact either the efficiency or common-mode performance. Or is there some other reason this might be important which I'm not aware of?

I'm sorry but I didn't understand your comment about AC vs DC analysis. You could of course capacitively couple a winding, resulting in no DC connection between the conductors, but this isn't typically done. And of course we always strive to make the AC impedance to be so high as to be negligible, but people don't always succeed at this -- which is the point I was trying to make.

I wasn't limiting my statement to the "Ruthroff" or "voltage" balun, or the "Guanella" or "current" balun. It's true for both. I have both the first and second editions of Sevick's book. Could you please point to a diagram or page number in either one which shows an impedance-tranforming balun, of any type, which doesn't have a connection between the two transmission line conductors?

In any impedance-transforming balun, careful attention has to be paid to the impedance of the winding(s) which appear between the conductors. In a well-designed transformer, this impedance is high enough relative to the differential impedance seen across the line to make it negligible. However, there are many baluns being sold and in use for which this isn't true, particularly on the lower frequency bands. My point was that a well-designed balun shouldn't have any appreciable effect on the differential-mode currents, but the extra factor of winding impedance has to be considered in order to make this true of an impedance-transforming balun.

Source record: 69279

In a post yesterday I presented a table of breakdown voltages as a function of rotor to stator spacing for air variable capacitors. In a note to Thomas C. Sefranek, WA1RHP, I realized that a little more information would have been helpful.

The added point is that the capacitor must withstand the combined AC and DC voltages across it. If you are using a choke-fed pi-network output stage with a blocking capacitor, the input variable capacitor sees only the AC voltage on the tube plate. But if you have a directly coupled tuned circuit (like the older link coupling), you will have the DC voltage plus the AC voltage. And if the stage is amplitude modulated, the DC voltage can be as high as twice the power supply voltage.

What this all boils down to is that the minimum capacitor voltage rating must be calculated for a particular circuit. Then you should apply a safety factor to this. The final peak voltage should then be used to select the capacitor spacing.

I think that Bob has been sneaking around my shack!

The approach he suggested of using a conventional unbalanced T tuner with ladder line is exactly what I am doing in feeding a 40-meter low horizontal loop. I use a W2DU balun between the transmitter and the tuner (an old Drake MN-4) input in the coax line. Surprisingly little trouble tuning up with very little 'body capacitance' effect noticed, at least on 40. The setup also works well up to 10 meters.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Need 2 meters, each 200 micramps F.S. 50 micramp movements can be used as well. The meters will be mounted in a panel opening of 2.2 inches. The older Lafayette or Radio Shack 50 microampere meters are okl. I'll use a small piece of panel material to compensate for the smaller hole requirments of those meters.

Thanks in advance.

It won't hurt, but it can't help? A most unusual condition where
change to an element in the path of power is benign.

This seems to pivot on the meaning of:
>noticeable difference
for which there is world of interpretative meaning. In the field of
advertising cheap Baluns, this expression is a boon to sales.

To quote Sevick (Sec 3.2):
"...the highest frequency response occurs when the characteristic
impedance, Z0, of the transmission line is the geometric mean of the
input and output resistances."
Given the ample illustrations that attend his work illustrating
considerable variation in high frequency characteristics, this is no
small achievement. In fact it would challenge any meaning of:
>noticeable difference

It seems that Sevick goes to considerable pain to develop the proper
transmission line for winding Baluns. He includes considerable detail
to describe his work with twisted pair, striplines, and coax
transmission lines in a wide variety of Impedances. He discusses the
intimate details of construction for every element and the trade-off
of one method employed over another. It seems that the sobriquet of
>noticeable difference
never entered his mind given the wealth of material devoted to this
single aspect alone. I can count at least 45 tables and charts that
show the frequency response of at least as many different Balun
designs. By far and a away, his concern is found with efficiency as
it relates to this transmission line equally with the coiled reactance
of that line. In fact, he builds the 1:4 so many times it is hardly
due to a fetish; rather, it is his stated agenda to examine the
implications of all variables as they impact efficiency. In his
examination of High Impedance applications (Sec 5.2):
"Ruthroff and Guanella stated that for the maximum high-frequency
response for a 1:4 transformer, the characteristic impedance of the
coiled transmission line should be one-half the output resistance and

twice the generator resistance (figs 1-2 and 1-3)....
"At the low frequency end, design considerations focus on the
reactance of the coiled transmission line as compared to the impedance
level (and hence, the characteristic impedance of the windings)."

The second paragraph of this quote covers your area of concern, but
it doesn't dismiss the first paragraph in terms of a barely
>noticeable difference
Sevick doesn't dismiss half the equation simply because a Balun
designed with a mediocre transmission line might work at a low
frequency. If that is the standard to judge a Balun by, it remains
only half a standard.

Hi Roy,

My point was that there are many Baluns sold for which there are no
supportable guarantees of performance (in this I think we agree). In
fact the marketplace takes these items for such a commonplace that
issues of performance and efficiency are dismissed too easily.

Bob OM,

A generator and an alternator are fundamentally different devices.
Look in your local library for automotive technical info, and a little
study will answer your questions. Or, taking a stab at it:
A generator's output current capability is a function of engine speed,
being lower with lower speeds, because the EMF generated by the rotating
armature supplies the current used to provide the magnetic field, so the
field increases as speed increases.
An alternator, on the other hand is, as the name suggests, an AC
GENERATOR. The output is changed to pulsating DC by a 3-phase rectifier
made up of silicon diodes. Its output current can be maintained at
fairly high levels, even at idle speed, because mostly all that changes
with speed is the frequency of the generated voltage. An alternator
requires a source of initial current (ie, from the battery) of
sufficient magnitude to provide enough field current to allow generation
of enough voltage to overcome the diode forward voltage, and thereby
start to charge an attached battery.
Yes, they both charge batteries. But a generator's small amount of
initial magnetization (remanance) in the field cores is enough to allow
the generator to start generating a voltage, without any externally
applied source of current. Thus, it can 'start from zero', and charge a
completely discharged battery, which an alternator cannot do. In an
application in which it is likely that a battery could be completely
discharged, one would prefer a generator to an alternator.
An alternator is more reliable and efficient, due mostly to the lack
of having a commutator and brushes that must pass the entire output
current. An alternator just has two slip rings which need pass only a
small field current (a few amps) to the rotating field.

Hope this helps.

I absoultely agree. However, I've read many, many articles and papers on baluns in which the wrong criteria were used in assessing the performance of a balun. Some contain huge amounts of data, nice graphs, and the like, all of factors which have nothing at all to do with a balun's ability to achieve equal currents in the two conductors. (I can make a really efficient, broadband balun very easily if it doesn't have to actually work, that is, if it doesn't have to effect equal and opposite currents in the two conductors.) So one must intelligently choose the criteria for performance to reach a valid conclusion about usability.

Source record: 69200

Check out the "Reference Book for Radio Engineer" to see that
altitude and temperature play a large role in breakdown voltage
thresholds. I am not familiar with breakdown voltage changing with
frequency, but certainly there is voltage multiplication occurring as
impedance's increase. For example, a 50 ohm filter might have
resonator voltage multiplication of 30 times in the middle resonators
at band edge. I suppose that since you are tuning for parallel resonance,
the voltage increases in the transmit path depending upon the Qu of
the tank circuit. As your query suggests, it is not trivial to estimate the
required breakdown voltage.

Sevick has done a lot of good work, but I feel that he sometimes loses track of what the purpose of a balun is.

A piece of transmission line a few inches long, with no core, connected as a current balun. Efficient and broadband, but poor at balancing currents.

Can you identify the genre or class of Balun, those
> that Sevick cover would be helpful, that suffer from this defect of
> character?

If I had to identify a class of balun that does a poor job, it's what I call a "voltage" balun. (I believe Sevick calls these "Ruthroff" baluns although at least some of the examples in Ruthroff's classic paper were somewhat different.) The reasons why, as well as my reason for calling them "voltage" baluns, are amplified in my article "Baluns: What They Do and How They Do It" in the _ARRL Antenna Compendium_, Vol. 1.

Yes, although one can use the correct general topology, such as the "current" balun made of a piece of transmission line, and still end up with a poor balun.

Going back to an earlier topic, I must have missed your response to my request for an example from Sevick's book of an impedance transforming balun which has no connection between the conductors. Would you be so kind as to re-post it?

Hi Roy,

All good and well, but without further statement, it sort of condemns
Sevick with the sins of all these contributors of statistical white
noise (otherwise known as tarring with a wide brush).

Can you provide us your assessment of his work? Is his data simply
sophistry clouded with numbers and prettified with charts? Are his
conclusions suspect? Are his models illusions, perfect for the page
and useless in the air?

I am intrigued that you can design a really efficient, broadband Balun
that doesn't work, care to share this example? I can see you
qualified this with a requirement to balance the currents. I always
presumed this to be in the domain of the load, but your example will
clear this up. Can you identify the genre or class of Balun, those
that Sevick cover would be helpful, that suffer from this defect of

character?

This statement of yours alone is worth considerable discussion as it relates directly to the charade of what is offered in the marketplace. If we are to be intelligent buyers in that market, then it would be helpful to be able to distinguish between methods of construction that conflict with this key attribute.

>too big and expensive for this homebrew project.
>
>Can anyone suggest a supplier?

QST for June, 1997, gave a practical project for mating an auto alternator to a small lawnmower engine. The result is up to several hundred watts of 12-15 VDC power. It should be used with a battery.

This is not a new idea - the same basic idea appeared in QST more than 40 years ago, and again 30 or so years ago. The 1997 article, however, uses the common vertical-shaft lawnmower engine, and almost any alternator. By using a small (3 HP) lawnmower engine and the alternator and battery from a small car, a compact and lightweight unit can be made.

I have seen new bargain lawnmowers for less than $90 in end-of-season sales, and rebuilt alternators for less than $25. Add a battery and some wire and hardware, and one might be able to build a complete unit for less than $150-160, with all parts being new.

561. Heater in YIG oscillator?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-19 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <7kfkoe$f6f$1@news.netcologne.de>
Source record: 69205

Hi,

what's the purpose of the heater in some (most?) YIG oscillators? Reduction of the drift of frequency only? So do I have to use the heater if the frequency is controlled by a PLL?

Peter

562. Material for interdigital filters?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-19 00:00:00 UTC

Message-ID: <7kfkof$f6f$2@news.netcologne.de>
Source record: 69206

Hi,

have the walls of interdigital filters (f around 1.5 GHz) to be made of thick metal sheets or will the 35 or 70 um copper of PCBs do as well?

I think of constructing such filters of rectangular brass rods (sidewalls) and sheet metal (bottom and cover) screwed tightly together. Will this do if utmost performance isn't needed? How about using (not anodized) aluminium instead of brass? Aluminium rods would be much easier to get.

Peter

YIGs get pretty hot when you leave them running all day with 400 mA or more on the main tuning coil, so the heater is probably there to maintain a reasonably constant temperature independent of the dissipation from the tuning coil.

Can't say for sure what would happen without the heater, as none of the HP/Avantek YIGs I've played with have separate heater terminals. Running one without the heater would probably result in a pronounced loss of tuning linearity, if nothing else.

564. Baluns & OCF Dipoles

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-19 00:00:00 UTC
From: tatasadasayago <Jcrosley@mocc.com>
Message-ID: <376B4C1C.BC4D1AF5@mocc.com>
Source record: 69208

I was reading W7EL's posts in here and the subject of baluns got me to thinking about the OffCenterFed dipoles I have built.
I dont have the luxury of any ARRL or other handbooks here, or I would look for the info that way.
My question is concerning just how a balun can equalize currents in two vastly different length radiators. I read about the OCF while at the library and went home and built one for 20 meters and another for 160. I used what I assume was a 1:1 balun(Possibly a Van Gordon) that came with an 80m 1/2A dipole I receieved with my first HF rig. I ran some tests and soon the OCF's were on the air and performing great. I think the book I read reccomended that I place the feedpoint at 25% from one end. I analysed the antenna with Elnec and found that 30-35% placement worked better to bring out the cloverleaf pattern I wanted at my target TOA. I must have done something right as I worked all 50 states in the 97 160 meter contest with 100 watts. Years later I am considering OCF's again, but would like to understabd the balun more. I had assumed that the OCF worked okay by virtue of having a 1/4A and 3/4A element working together to provide a close to 50Ohm load. But at 30% or more offset, how was this working so well? Does the balun provide any sort of current lag to the short end to allow the voltages to be equal at each end at 180 and 360 degrees?
Maybe I am missing the fundamentals here. I visualised the balun to be two seperate "Loading" type coils taking my RF from the feedline and distributing it equally to each half of the dipole regardless of the length of each radiator. Can anyone attempt to explain how this works with an OCF and 1:1 balun?
Sincerely, Jim
KY7DX/QRP Montana

565. Re: Duplexer Or Cavity ????

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-19 00:00:00 UTC

Source record: 69209

At 5-Mhz seperation, a bandpass cavity will have
excellent rejection. You might also consider looking into
an inexpensive "mobile" duplexer for 5-MHz operation.
Should be very inexpensive used. "Split" the duplexer
and use one section on each antenna feed.

>is stupendous.

The books are fine, but it would have more meaning if there
were amateur radios whose S meters actually responded
with 6 dB per S unit over the range of their scales. The only
one I know of which repeatably does is the Kachina 505. It
auto-calibrates itself at power on across its entire range in
dBm, and then converts readings to equivalent S units in
software.

More typical amateur equipment varies from 2 to 8 dB per S unit
over the range of the S scale, and varies similarly from band to
band and radio to radio. Since the variance is as large as the unit,
it becomes basically worthless as a method of discussing signal
strength information. Until instruments are in general amateur use
which do better, using the S unit is more misleading than helpful.
It is like giving measurements in yards when the typical yardstick
in use varies in length from 1.19 to 4.75 feet.

You can suggest that amateurs should do calibration charts for
their S meters, I have done so for my radios, but few amateurs do.
It is better to give the measurements in a scale for which amateurs
typically don't have faulty instruments to measure. That way it is
less likely to mislead by association.

When amateurs report HF antenna signal strengths that differ
by 2 to 3 S units (as many do), it is virtually certain that those
antennas don't differ by 12 to 18 dB in gain. The large variance
is almost certainly mainly a function of the variance in the S
meters employed. I think it is important that we get amateurs
to disassociate their thinking from what they erroneously see
on their S meters. We do that by acknowledging that the S unit
is typically *not* 6 dB in the real world of amateur radios.

AMEN, Gary! This is particulary irksome when the S-meter readings are used to "measure" performance, such as the signal increase due to an amplifier or new antenna.

The S-meter (or guess-meter) has distorted the average ham's concept of the decibel!

5000 plus tubes. 7, 8, and 9 pin. loose not tested. I have been told, many, (some ?) of these where indeed not used. And were removed from water damaged boxes. I can not comfirm this, nor do I believe this to be true. I do know that many I've tried, for my own use have worked well. They are being sold as used, as is, not tested. They are not sorted, and I will not do so. I will not sell
singles.
I'm asking $25.00 per 100 count. Or your best offer for all 5000 plus tubes. You pay all shipping cost. I will determand shipping cost, based on how many you purchase, at time of sale.
When responding, please state where you've read my posting.
Thank you for your time.

571. AM reception on FM receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-19 00:00:00 UTC
From: David Cunningham <D.L.C@btinternet.com>
Message-ID: <7kgm3cdhe1@plutonium.btinternet.com>
Source record: 69215

I was recently experimenting with an FM broadcast band radio. I disconnected the mixer from the first IF transformer and connected the output of a homemade mixer to the IF amplifier for reception of other bands. I found that the IF amplifier and FM detector was able to resolve AM SW stations. I wondered why this is, and my theory is that cheap FM radios do not have a limiter stage. Can anyone confirm this?

Best wishes from John Cunningham.

You speak of equally distributing "RF" from the feedline. By this I assume you mean RF energy or power. I don't think you really want half the power going to each half of the antenna. If you do, why?

The purpose of a balun is to prevent the feedline from radiating, which is the same as saying that its job is to suppress common-mode current, because it's the common-mode current that radiates. If you have no common-mode current, then the currents in the two conductors are purely differential, that is, they're equal in magnitude and opposite in phase. So when a balun does its job, you're applying equal and opposite currents into the two halves of the antenna. The fraction of the power that each half receives is determined by their lengths and current distributions. If the feedpoint currents of the two halves are anything but equal and opposite, the feedline WILL radiate.

A radiating feedline is just as much a part of the antenna as the part that's intended to radiate, and it contributes to the overall field in proportion to its length and the current it carries. This contribution always radiates in some directions, and might allow communication that wouldn't be possible if it weren't radiating. I see this as a kind of haphazard way to communicate, but lots of people do it, and it's fine as long as the radiating feedline doesn't cause other problems like coupling to power and telephone lines and so forth.

Provided that your antenna is reasonably efficient (which most half wave or larger antennas are), essentially all the power you're applying to the antenna is being radiated. Having gross current imbalances in the wires, and having a radiating feedline, don't alter this fact (except that the radiating feedline might reduce efficiency by losing power to nearby lossy objects). So there's no reason you can't win a contest with a crazy current distribution. But your pattern sure won't be what a modeling program or the textbooks tell you, unless you've included the radiating feedline in your model. Using a balun won't increase the amount of power you radiate or increase the efficiency of your system (except possibly if the feedline is coupling to lossy objects). All it will do is reduce the fraction of that power that's radiated by the feedline. In the process of doing that, it'll also change the relative currents in the two halves of your antenna, changing its pattern somewhat.

Jack Belrose, VE2CV, wrote an article or two about off-center fed dipoles in QST a few years ago. I recall his mentioning that it's very difficult to reduce the common-mode feedline currents with these antennas. My guess is that it would take at least a couple of current baluns placed about a quarter wave apart to get a reasonably low level of common-mode current on some of these antennas.

Hmm, that didn't clear it up. Except perhaps that it isn't Balun. It
provides no balanced to unbalanced transitions. There is no mention
of it conforming its extremely short transition line to "the geometric
mean" of Z between the input and output. It does no transform for
which I must presume it connects a Source Z to an identical Load Z
(which might presumably remove the last objection). It is described
as being "connected as a current Balun." I might allow that this is
the "beaded" variant, but that is unstated, and this leads to more
presumptions. It has no core and the line being a few inches long
has almost no reactance due to coiling to isolate the input from the
output (unless we are now confined to Baluns for UHF service, another

presumption).

Here presumptions again force me to think that this example and the
one above (described as being efficient but poor) are one in the same;
however presumptions are getting a bit thick. For the intelligent
buyer's benefit I asked for a distinguishing feature of a poor
design, to my surprise it appears to be the popular W2DU design.
However I suspect this is a combination of presumption and stated but
unidentified instances of its failure(?). In that regard, I must
pass on this being an answer in that it appears (another assumption)
to be more an issue of poor application than design.

Hi Roy,

You missed my response? Now THIS is a presumption - there was none.

Now if you wish to resurrect that issue, fine and well, it is my
responsibility to explain it again having flubbed it earlier in terms
of DC and AC analysis.

Perhaps you missed my earlier correspondence where I describe, simply,
that a Balun's principle design considerations where to isolate the
input from the output and to provide a line Z designed for transition

per these repeated references (sorry for preaching to the converted)
>To quote Sevick (Sec 3.2):
> "...the highest frequency response occurs when the characteristic
>impedance, Z0, of the transmission line is the geometric mean of the
>input and output resistances."
Or
> (Sec 5.2):
> "Ruthroff and Guanella stated that for the maximum high-frequency
>response for a 1:4 transformer, the characteristic impedance of the
>coiled transmission line should be one-half the output resistance and
>twice the generator resistance (figs 1-2 and 1-3)....
> "At the low frequency end, design considerations focus on the
>reactance of the coiled transmission line as compared to the impedance
>level (and hence, the characteristic impedance of the windings)."

In this regard of isolation (the AC analysis spin), the far end of this transition line's connections are removed from the near end - the point of Balun construction it seems to me. However, this must be accomplished by a sufficient combination of added reactance and resistance in the coiling of the line to accomplish (your point - mine too). Having achieved this high level of Z accomplishes the removal of connections at the far end (my point & perhaps your point - I hesitate to ascribe this tho'). That these connections are still made, and that the transition line still is connected in such a configuration to achieve an impedance transform (your point) is in fact well evidenced from a DC perspective (my point).

In retrospect my assertion was perhaps too subtle. That is, having achieved isolation, I immediately dismissed the far side's connections (other than those to the load) from further consideration. A slight of hand none-the-less, and definitely not true when a formal analysis (that allows me to make this subtle distinction) requires all elements to be considered (much as you stated).

For others following this; all of this last of mine must appear to be tedious and abstract. I think however that it illustrates the chief mechanism of Balun operation. The key to both design and application is to recognize that this transition line's input and output are isolated from each other by the mechanism of either winding this line (air wound), passing it through core material (including core wound), or finally, making it 1/4 wavelength long. This isolation allows that either side of the Balun may be configured with two or more transition lines (in the common case of a Balun that also transforms Z) in parallel and series to accomplish the "step-up" or "step-down" in Z. A simple example may help.

First a failed attempt (much like Roy's efficient design example above):
Consider two transition lines that are fed (at the near end) in parallel; then these lines are re-terminated at the far (load) end in a series configuration. Fire up the transmitter and you may even fire

up the Balun (sic) - certainly no merit in this (especially when the fire spreads to the transmitter). Let's amend this faulty construction through one of the isolation mechanisms above: Consider two transition lines that are fed (at the near end) in parallel; these lines are then coiled through a core as non-interacting windings, and then re-terminated at the far (load) end in a series configuration. Bingo, we have a Guanella 1:4 Balun and with the appropriate load it presents very low loss (and a very low chance of "firing" up).

It is instructive to note that this last example can be built on the conventional single core, but more interestingly it can also be constructed from two W2DU style current Baluns. I say interestingly because it illustrates the nature of isolation and the series-parallel combinations quite clearly. The Ruthroff model of the 1:4, on the other hand, is a mind twist to analyze with its three wire construction and lacks the elegance of the simple Guanella implementation. In fact, it is this third wire that so confounds Ruthroff designs. The third wire violates the isolation of the input from the output. Now this violation does not condemn it, but it does impose constraints against some applications that the Guanella performs in quite well. The Ruthroff model may be implemented in the style of a W2DU Balun, when the third wire is added and the load shifted to bridge the input and output of the W2DU balun. The hazard of this is that if done wrong, you could find yourself with an Unun instead of a Balun (and as I have loosely described it here, that guarantees that possibility is 50% - if not worse. Sorry folks, I wish graphics weren't so bandwidth intensive, otherwise illustration would be worth 1000 words).

Now to return to the requirement for the transition lines' design Z. For my simple example above, where I employ two store bought W2DU Baluns in series/parallel, if taken as stated; then we do not have an optimal solution. It is arguable how much optimization is needed - until we attempt to apply the Balun to where its operational boundaries are crossed (an unknown hazard if one casually discards the treatment of transition line Z). As this thread was launched with the intent of construction techniques rather than buying a solution off the shelf, it follows that one may as easily construct one's own W2DU style Balun with appropriate transition lines (and cheaper too). Knowing that the load is going to be 200 Ohms means that the two transition lines must present at least 100 Ohms characteristic Z each (100 in series with 100). Knowing the source is going to be 50 Ohms means that the two transition lines must present at most 100 Ohms each (100 in parallel with 100). If we do it by the math we find the design requirement stipulates Z = SQRT(50 * 200). The design Z mandates 100 Ohms. The Guanella design thus presents rather more simple analysis and construction requirements. To make an optimal solution seems to me to involve slightly more effort (by paying attention to the Z of the transition line) than a haphazard wind of pair of handy wires.

574. FS: Crystal Filters, 3.2 Khz bw and 200Hz bw

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-19 00:00:00 UTC
From: Bob <bmiller@calweb.com>
Message-ID: <376be7fb@calwebnnrp>
Source record: 69218
Cross-posted to: sci.electronics.components,rec.radio.amateur.homebrew,rec.radio.swap

For Sale: Pair of new crystal filters.
Filter 1 is a nominal 3.2 Khz bandwidth, brick wall, 7 crystal elements, termination around 560 ohms to 1 k. 5.2 MHz corner frequency

Filter 2 is approximately 200 Hz wide centered on 5.2 MHz

Includes 5.2 Mhz injection oscillator crystal which will provide USB injection for the 3.2 Khz filter and band center injection for filter 2. These units are maintenance spares for Motorola DTL FDM multiplex modems. Great for home brew receivers and hi fi SSB generators. 200 hz filter is kind of narrow for cw, but great for nsk low speed data.

$35 for all the three items post paid conus

Thank you for the read.

Your best bet is to have the resonators and the cavities plated with
silver, on top of aluminum plus whatever material goes inbetween for
proper plating. I understand that this might be difficult for a "home job",
but if you can get access to a plater, your losses will be minimal.
Also, be aware that interdigital filters have a tendency to have repeating
passbands at harmonics.
As you probably know, Qu= squrt(f) * D * k, where
f is frequency in GHz., D is the dominant dimension of the cavity size in
inches, and k is a constant. For silver, use about 2200 for k. So for a
2" cavity, you can expect a Qu of over 5,000 at 1.5 GHz.

Yes, very good assumption and probably what is
happening. Very few consumer FM receivers have
anywhere near the limiting action of good commercial
two-way radios--many of those sets have the later IF
stages running into saturation on noise alone. I even
notice the expensive Radio Shack FM receiver in my
van has a volume fade when the signal phases or in
weak reception areas--in a good receiver the noise level
would rise to equal the audio which should remain
at a constant level.

Why can't you use The FT-50R with the ADMS-1D. It's what I use with my FT-50, if I'm not using one of the freeware implementations like the one written by a ham in Macedonia. I can't understand your question, if you have the 1D, you can use it with ADMS-1D whether it's modified or not. Personally I prefer not having the ability to transmit out of band, but for just listening, no problem.

>to reduce my frustration level! :-)

Continental Morse is what we use on the radio today. American Morse was used on US landlines. Continental Morse was used on landlines in Europe. Both were originally "clicking" codes. When radio came along, Continental Morse, renamed International Morse, was adopted as the standard radio code. Some of the characters are different. For example, C, which is dahdidahdit in Continental Morse is didi<short space>dit in American Morse.

Landline sounders gave a distinctively different sound for the make and break of each element. It was a click-clack. The timing between the click and the clack determined whether a dit or dah was sent. It is necessary that the make and break have different sounds, otherwise you can confuse an intracharacter space with a dit and a letter space with a dah. On radio we use tones of different duration, and the absence of tone, to convey the code elements. The absence of tone is as important as the tone to the code, just as the click and the clack are important to the landline sounder system. You can't reliably copy code that's just clicks any more than you can copy code that's just tone. You have to be able to tell make from break.

Discerning the absence of tone against the noise background can be difficult for weak signals (or fading signals). The best way to do that is to use two tones, ie FSK. That way energy is sent for all of the code elements. In fact that was done with the old arc transmitters where the arc couldn't be conveniently broken and re-established rapidly. A reactance was switched across the tuned circuit to key it FSK, one frequency for dits and dahs, another frequency for the intracharacter, intercharacter, and word spaces. It works better than on off keying (6 dB better), and can be copied by ear by anyone who is not tone deaf.

Morse is a quintenary code, ie it has 5 distinct transmission symbols. It only voices two of them when on-off keying (OOK) is used. The other three have to be inferred against the noise background. That hurts its weak signal performance. Voicing all the symbols improves matters. Voicing them distinctly in signal space would be best, ie rather than just using two level FSK, a 5 level M-ary modulation would be even better.

If you then use uniform length transmission symbols, ie a different code, you have RTTY and all other modern methods of text transmission. Because the elements are uniform length, you can form a matched filter for them, and weak signal performance is further improved over an irregular coding like Morse.

(At least 9 dB better, more than that if you use FEC techniques too.)

We usually use that advantage to allow us to run much faster rather than to work weaker signals. But if we slow a modern code down to the speeds used by Morse operators, we can work at weaker signal levels than the Morse operator. A good example is Voyager, which works over a 9 billion mile path with less than 5 watts of power. It operates at 10 bps (about 12 WPM). OOK Morse could not be detected by ear at the signal level of Voyager. Machine methods couldn't do it either. Only changing to a different modulation and coding allows such weak signal work to occur.

I bring this up because I've been experimenting with a 10 bps QPSK system on 30m for the past couple of years that works when I can't detect the presence of a signal by ear. It is conceptually similar to PSK31, but slower, and doesn't employ varicode compression. The main drawback to such extremely weak signal methods is that very good frequency stability is required of the transmitter and receiver.

For hams, another drawback is that finding stations calling "CQ" can be difficult because they're too weak to hear. You have to depend on the signal processor to tell you a signal is present when you tune, very slowly, across the band. PSK31 is a better compromise for hams. It has to be strong enough to detect by ear, or at least on the waterfall display, to work, and the faster speed is beneficial to conversation too. We rarely have a need to work at the most extreme weak signal level.

(Sorry for the topic drift, I got carried away. Coding and modulation methods is one of my favorite topics.)

>with an OCF and 1:1 balun?
>Sincerely, Jim
>KY7DX/QRP Montana

If you look at the current on an antenna, at any point, the current
immediately to the left of the point is the same as the current
immediately to the right of the point. Doesn't matter where you
cut it, the current has to be the same on either side of the cut.

Now when you have a transmission line inserted at the cut,
you'll have an equal current flowing into one conductor from
one side of the antenna and out of the other conductor to the
other side of the antenna. In other words, it is still purely
differential, no matter where you cut the antenna and insert
the feedline.

The purpose of the balun is to suppress common mode
currents on the coax. It does that by acting as a high impedance
for the common mode currents. Since the antenna only needs

differential currents no matter where it is cut, the balun still performs its job. (We're talking choke baluns here.) The impedance of the balun to common mode currents may need to be higher when used off-center than when used in the center of a dipole, but it performs the same job in either location.

Yes. This is to suppliment a solar/battery system. While
that system can easily handle the 6-8 operational hours per
week it was designed for, it can not handle the demands that
field day would place.

> (Sounds like you do Field Day planning like we do -- two weeks
> or less before The Day. :-)

Actually, I'm currently planning for 2001. With my construction
skills, it will take that long to get things together. 8)

On the other end, each tube has 1 adjustment screw.
So I'm told by one of our local hams, I should go back and buy the bridge
the guy was selling also, cause what I bought is "JUNK".
My question is > will it work good enough for a business band repeater with
5 mhz split.
Dano
P.S>
in case anyone wondering, the factory tag was marked for 154 mhz in, 159mhz
out.
& the make is a Phelps dodge.

594. Japanese transistor model codes

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-20 00:00:00 UTC
From: Frank Dinger <frank.dinger@zetnet.co.uk>
Message-ID: <19990620164024704 32@zetnet.co.uk>
Source record: 69094

Perhaps a very silly question .
I have many ex-equipment Japanese transistors with model codes like
A1012 ,D880 , D549 , B383, C805, etc.
With known Jap. models in the 1SA -----2SB --------3SC range ,can
I take it that in the above codes the 1S or 2S or 3S part has been
deleted , or are the codes not related to the S -series designations.

Would appreciate being informed about a site where the said
semiconductors are cross referenced with other (almost) equivalent types .

It will work fine on a five MHz split. It will not work on amateur 600 KHz splits. Phelps Dodge is now Celewave. If you have a model number, Celewave might be able to help you with technical specs. Based on the size of the unit, it sounds more like a repeater than a mobile duplexer, and probably has some good isolation specs at 5-MHz spacing. It sounds like a full-sized base repeater unit according to your information. It is not junk.

Hi Will & my e-mail correspondents,

Having gone so far, I have been asked to go further (that is with construction ideas and details).

Will, I believe you were intending to work with 450 Ohm transmission line. I doubted that you would find a load that large, but on reflection observed that you were going for a one antenna fits all bands approach where yes, you would encounter huge R's presented to your system.

Sevick presents an entire (actually several) chapter(s) devoted to Hi Z loads, and specifically provides design details for Baluns that transform to loads of 300 Ohms, 450 Ohms, 600 Ohms and 800 Ohms (my interest is in his designs for loads of 3.125 Ohms, 5.56 Ohms, and 12.5 Ohms). I can't respond to my correspondents clamor for design specifics for all of their needs without denying the author his due insofar as royalties. Simply put, order his book "Transmission Line Transformers" in spite of the tepid response evidenced in this thread for his work. As such I must point out to these individuals that I have already discussed the cogent details of construction (less the actual, literal recitation of items used - trust Sevick to be VERY complete in this regard). Further, this is the point of amateur radio (or at least one of the points) do it yourself!

Now, that is not to cast you all adrift with fond wishes of success. So again the cogent points are (again from Sevick):
"Ruthroff and Guanella stated that for the maximum high-frequency response for a 1:4 transformer, the characteristic impedance of the coiled transmission line should be one-half the output resistance and

twice the generator resistance (figs 1-2 and 1-3)....
"At the low frequency end, design considerations focus on the reactance of the coiled transmission line as compared to the impedance level (and hence, the characteristic impedance of the windings)."

These are NOT rocket science requirements. If you reflect on the description of my simple example quoted above, you will observe that common sense prevails and that there are actually very few stumbling blocks to building your own Balun to your own requirements. The hardest part is the transition line (as I have taken to calling it, to distinguish it from those transmission lines (or source/load Z's) that interface to the Balun from either side. As Roy suggests, even here we may be forgiven the transgression of lacking exact implementation. However, I would point out that Sevick also relaxes this requirement, BUT he also provides a rule of thumb that should satisfy even the faintest of heart. That relaxation consists of an equally simple rule: if you cannot (or don't have the heart to) build a specific impedance transition line; then at least build (or use an existing) transmission line that MATCHES THE LOAD (OK, so I guess that means that the faint of heart may as well trust to luck and that pimply sales clerk's recommendation if that line isn't available - or he can't find it behind the counter).

So, to add a third rule: wind that transition winding in the transmission line that you will use to feed the load.

For those hearty adventurers that are willing to invest their effort in building their own transition line, I offer BRAVO! Unfortunately I cannot offer the services of a qualified bench assessment of those lines in the confines found in winding this line around a core. Please observe that Sevick found that his 300 Ohm line acted like 200 Ohms in service. I offer this as a hallmark, but cannot foresee how your design will be delimited in service. I do hope that his experience will serve to encourage you though.

More to the matter, Sevick does provide a way to measure the success of your design. It is not remarkable, but it is (like his other work) serviceable and achievable. It is called the "soak test." Simply put it requires you to build TWO of your designs, connect them back-to-back-to-50 Ohms and key down. As I stated in other postings, you may measure (roughly) the efficiency of your design by the amount of heat generated by it. The "soak test" is exactly this. Presumably (and I am aware how loaded that word is), your two models will either pass the test coolly or provide you entertainment in advance of the 4th of July.

So, buck up and observe the few, but significant keystones to building a serviceable Balun. There is no pedantic requirement for absolute efficiency (as long as you take responsibility for testing its service). About the only topic that remains is that of the core material (unless you are going the air-wound or 1/4 wave route). Here I will back off and suggest you visit Amidon's VENDOR page (at

http://bytemark.com I believe) as this is another variable that I cannot anticipate for all of you. However, even here, you have been offered clues by other contributors to this thread (type 77 comes to mind from Cecil's excellent posting - but again, this is frequency dependant).

The "book larned" requirements are myriad in regard to selection of all parts of a Balun, but keep in mind they devolve to few when you define your needs and this makes the challenge manageable. Again, to recite the key points:
1) select a core material that fits the range of frequency for your service;
2) determine the Z ratio you wish to transform (highly dependant upon your source and load in their application);
3) determine the combination of series and parallel arrangements of a suitable number of transition lines to achieve this ratio (more about this below);
4) select, or build those transition lines employing the simple math of either twin lead or co-axial line Z's (please consult a good reference in this regard - or ask me);
5) determine the number of windings that will "swamp" (or what I called isolate) the load (generally, treating the coiled transition line as a single wire inductor is sufficient to determine this X and R), the rule of thumb is that X+R should exceed the load by at least 5 times (better if 10 times);
6) do the winding, the soldering, and the final soak test.

As for ratios other than 1:4 for a 50 Ohm transformed to 200 Ohms consider how simple it is to achieve 1:9 with the same example found above. Three individual transition lines of Z = 150 Ohms, when isolated by the prescribed methods above, can be put into service with the same simple parallel/series configuration. You may note in my recitation of Sevick's provided examples, that he has some rather odd Load or Source Z specifications (why 5.56 Ohms? why not simply 6 Ohms?). The answer lies in the method of series and parallel combinations being integral (as in Integer) combinations of these same lines (that is 5.56 is 1/9th of 50). Don't let this limit you. Sevick also provides what are called combination designs. Simply put these are cascaded Baluns that when we transform Z we do it again through a second Balun to render yet another Z.

As I've said before, Sevick provides quite a few different models. However he provides only a few different ratios in comparison. His goal was to investigate the variables involved, not provide a cookbook for timid souls. I am sure he also considered his readership to be of high enough calibre to both originate AND TEST their own work. I cannot in this short monograph serve with completeness to this regard - buy the book, or experiment on your own. There is undoubtedly much that I have left unsaid - I will leave those as specifics of implementation rather than design generalities. I have purposely ignored those designs that are Ruthroff models, not because they are

less robust, but because their discussion would bloat this posting beyond belief (and yes, they are less robust, but serviceable for the amateur of high calibre). Again the suggestion of "Buy his book" serves this shortfall (and others).

Do it!

I custom build <1 at a time> some darn nice 2 meter antennas!

3 EL Yagi-30.00 These are all aluminum, gamma fed, nice looking and
working
yagis...The Jpole is all aluminum, goes together
in 2 shakes,
4 EL Yagi-37.00 and is 3/4 wavelength long. These are excellent antennas,

and have sold out at local fests and club
meetings each
5 EL Yagi- 43.00 time I bring 'em.

Jpole<3/4 wave length>-23.00

Each antenna comes with an instruction sheet and all hardware to have it up and running in minutes. The yagis have gamma rod assembled and attached to the driven element. The Jpoles come with pre-drilled set points for tuning at 3 points in the band.

I am not some web scammer, I just like building antennas. You can reach me by this email address, by my call book address, or by sending a note to my call sign at PO Box 2189 Schiller Park, Il 60176.
Chicago area hams may arrange for local pickup.
SHIPPING IS $8.50, regardless of antenna. I will ship 2 of any one for $11.00.

INCLUDE YOUR EMAIL ADDRESS IF YOU ORDER BY MAIL...Checks or Money order payable to Doug Adair only...this is not a big business...I am just having fun and helping new hams not GET RIPPED OFF!

Thanks guys...73 and CU on 6 METERS!!!!!!!!!!!!

From: Dennis Sweeney <dsweeney@vt.edu>
Message-ID: <376C96EF.2A2098D7@vt.edu>
Source record: 69229

I have successfully built a number of interdigitated filters between 900 and 2400 MHz using PCB material and aluminum for the side walls. The end bars and the resonator bars were made of brass. My 3 element 1% bandwidth filters at 2400 MHz have approximately 1 dB of loss. This has proven to be more than adequate for amateur applications.

As the frequency increases, the majority of the current flows in a thin layer at the surface of the conductor. This is called the "skin effect" and as long as the metal is a few skin depths thick, it might as well be sold. Tubing will work just as well as solid bars for the resonators and the metal foil on PCB material is plenty thick. Silver (or gold) plating is used to reduce the surface resistance and prevent the formation of high resistance oxides. While lower loss might be obtained with silver plating, it doesn't seem like it is worth the extra effort.

A better indicator of loss is the enclosed volume of the filter. The bigger the filter, the lower the loss. I typically build my filters with 0.5" ground plane spacing and 0.25" diameter rods. Some might argue that lower loss can be obtained with slightly smaller rods. They are probably correct, but again it is probably not worth the effort. Half inch bar and quarter inch rod stock are easy to come by. Also narrowband filters tend to have higher loss and the loss goes up with the number of resonators.

When I build filters with solid resonator bars, I use a screw through the end wall into the end of the resonator. This will work with either aluminum or brass. When I make filters with tubing, I often solder the tubes into the end bars. The brass can be easily solder.

Have fun making filters,

Dennis Sweeney

I have an old SCSI cd rom, the type which is an external mains powered unit rather than one which fits into a spare slot in a computer, and wish to use it to play audio cds without having to connect it to the computer. There are 2 RCA sockets on the back for audio output, and 2 SCSI connectors. I am assuming that I will be able to make cd-rom drive perform functions such as play, skip,stop etc. by feeding a 5v pulse to the appropriate pin on the SCSI connector.

Can anyone confirm this, and provide a pinout for the SCSI connector?

First off, Phelps never made Junk :-)

OK I'm not sure what you want to use this duplexor for, but assuming you want to re tune it to your desired frequency you will need a tracking generator and analyser. I presume you haven't got one or you would already know this.

You *can* use a receiver and signal generator to tune the filter but you need practice and in truth the results are rarely as good as a properly aligned filter.

You can set the notches as best as you can by putting the signal generator into the opposite port and tuning the notch for best rejection. (i.e. minimum signal)

What you are trying to achieve is rejection of the TX frequency on the RX port and a hole in the TX filter tuned to the RX frequency.

If you tune it like this and the filter isn't duff, the pass band will look after itself.

Don't forget to terminate any un used ports in 50R whilst tuning.

Typically 60-70 db of isolation is possible and the band pass section insertion loss will be about 1db.

If you can't achieve these figures DON'T try to use the filter on the radio.

I would recommend that you find a local PMR technician who will have the required gear in the back of his van, ask him nicely for help and watch how he tunes the filter. Once you have done a few they are easy but the first ones you might need guidance....

HTH

Well, I seem to have exhausted the WWW in searching for written material on glowbugs. Harry's Homebrew Page seems to be the best, at least fairly large, orderly, and with a friendly host. So, what I need is a list of about 10 or so solid books introducing principles of tubes and RF, presenting a few circuits for construction and study, and giving heavy info on troubleshooting and modifications (say I start with a MOPA crystal-controlled TX and want to add a VFO, that sort of thing). I know about the Radiotron Designer's Handbook {sic} and Bill Orr's Radio Communications Handbook (still looking for both of those at a price a grad. student can afford, in any complete condition), but there *must* be many more, of 40's and 50's editions especially, that I need to know about. So, what are they?

Got a processor board for my FT101EE. I can match up the colors from the harness to the board, simple enough ! After doing this there were two pairs of wires on the radio harness (white/yellow & white/gray soldered together the other pair white & red soldered together) Looked like the bypass loop for the rig when it ran without the processor option. Unsoldering these resulted in matching up the white/yellow, white/grey and red wires to those from the board. Now I have a white wire left ! There was no white wire from the board I bought and I was wondering where this wire will call its new home on the board. With just the operators manual I am a little lost since it does not mention the upgrade proc. option installation. It seems the white wire has around +12v on it and the board has a white/orange going to the +12v terminal on the board. The way it is now the unit allows the rig to modulate but without any processing so It must be ok for the most part (since the op-manual describes the circuit as an amplifier in the proc/off position). It does this (but with increased ALC sensitivity) so I am close but no better than without the board. Has anyone installed one of these or can see where the white wire goes to on the pro. bd. in their rig? There is that white wire with a very faint yellow marker connected so don't let this be confused with the plain white. Appreciated any help ! Jacqui N1DVE jaclyn@tiac.net

616. Want to build a repeater

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-21 00:00:00 UTC
From: John Wheeler <kd5bcu@nospam.sydcom.net>
Message-ID: <929973060.074.80@news.remarQ.com>
Source record: 69110

My brother is a member of a Volunteer Fire Dept. The Powers-That-Be, in all of their infinite wisdom, have decided to move the repeater that the VFD used to a better location. Better for who? Obviously not the VFD. Anyway, on to the meat of the problem. Since the repeater has been moved, the handheld radios that the VFD uses can't reach the new location. They have a number of old single channel mobil radios ranging from 100-140 watt output. They also have a couple of towers that they can use. The question is this: What all would be involved in building a repeater? Keep in mind that this is a volunteer organization and whatever they do, needs to be done as cheaply as possible, but also needs to be done in a reliable manner.

Any suggestions are greatly appreciated.

Hello Will,

Here are some suggestions:

- The ARRL Handbook - Issues from about 1952 to 1966 are the prime ones for hollowstate stuff.

- Understanding Amateur Radio - An ARRL book from the early '60s meant for the beginner. Good explanations.

- A Course in Radio Fundamentals - An ARRL book on radio basics.

- Reference Data for Radio Engineers - An IEEE/IRE book in various editions. '50s versions are the best.

- Radio Engineering (I think that's the title) by Fred Terman.

- RCA Receiving Tube Manual and RCA Transmitting Tube Manual - Late '50s and early '60s editions are the best.

Radiotron is available on CD-ROM, I'm told.

A collection of old QSTs is invaluable, too, or get the CD-ROMs.

What sort of pojects are you looking to build? Perhaps I can help with questions.

621. What Impeadance is this coax

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-21 00:00:00 UTC
From: mike@corn2.freeserve.co.uk
Message-ID: <376e79af.1234878@news.freeserve.net>
Source record: 69115

Hi There Folks, I bought a load of 'rather nice' coax at a flea
market on sunday. I thought it was 75R stuff but now I'm not too sure.

My chart for approximating coax impeadance seems to indicate about
100R , what do you think?

diameter of inner core - .021"
diameter of ptfe inner insulation - 0.142"
outside dia of sleeve - 0.225"

The inner seems to be either hard drawn copper, or copper coated steel
the inner insulation is a solid ptfe
the outer braid is firstly a copper coloured sheetmetal of 0.0015"
thick , followed by very fine braiding on top.
and the outer sheath is some sort of hard grey plastic

any idea's what it is, either type number or approx spec would be
useful.

Many Thanks.. Mike W G8NXD

Hi Mike

I put your data in the program "Hamcalc" (by G. Murphy, VE3ERP)
and get the follwing results:
Impedance 79 Ohm
Capacitance 18.62 pF/ft.
Inductance 0.116 ï¿½H/ft.
Velocity Factor 0.69

Hope this will help

Source record: 69118

From the dimensions you give, the Z0 works out to 79 ohms. (Perhaps you neglected the effect of the dielectric in your calculations.) So it's probably 75 ohm cable. I didn't find anything like it in the Belden catalog, but you might check their web site, and those of other cable manufacturers if you want a part number.

Copper-clad steel is commonly used for the inner conductor of small 75 ohm cable. You can cut a piece off and check it with a magnet, but it won't make any difference from an electrical standpoint except at very low frequencies (probably low MF and below) unless the inner conductor is stranded. (If it's stranded, the copper may be thin enough to cause increased loss at lower HF and below.)

From: stoskopf@tri.NET
Message-ID: <376E9B06.7540D853@tri.net>
Source record: 69119

I bought one of the ComFocus radios at Dayton in 1994. This was a RX only Kachina with similar bells and whistles. The company seems to have quickly gone belly up so support is gone. I just dumped the Win 3.1 box I used on the workbench and now find that I can't run the software under Win98. Can't get it to load some of the files to Windows.

Anyone have a clue where the assets went? Anyone have the install disks that I can get a copy of in case mine are corrupted.

Perils of buying a low SN device.

Thanks,

N0UU

Thanks Gary. It was early in the morning!
On the same subject, there was an interesting letter to the editor in today's Wall Street Journal. A follow-up to their front page article on the great Morse debate. Fellow described how Morse was used by prisoners sending messages via the plumbing. In this system there were no clicks and clacks to distinguish, so the dot was a single tap and the dash was a scrape along the pipe. Interesting.

Are you saying that "any" permanent magnet DC motor can be used
as a generator?

The lawnmower engine with alternator idea (that several have
suggested) is good, but too bulky and heavy for what I'm working
on. I'm looking for something smaller than a car alternator, but
bigger than a bicycle light generator.

A motorcycle alternator might be closer, but I think most of those
run 6V when I need more than 12V.

I get 76 Ohms assuming The dielectric constant of ptfe=2.5- that's close I don't have that memorized. We don't need to know the outside diameter of the shield.

That is part of it, but there are other reasons for heating.
Spurious modes can occur at certain temperatures. By choosing an
oven temperature that does not support these modes eliminates the
problem. Turning off the oven makes the oscillator vulnerable to
these modes. If you want to go heaterless you should tune the
oscillator over its whole range as you slowly warm it up from say
60 degrees F to 80 degrees F, or whatever ambient range you will
be using. See if it behaves itself in all cases.

The alternator plan mentioned is pretty viable. To simplify your project
you can get a chevy one-wire alternator. V-reg is built in, not too great
to work on, but initial setup would go a little quicker. The model a/c
engine sounds interesting because the glowplug won't make spark noise.
Cooling might be a problem though

The Japanese numbers I've looked up in the past always have cross referenced
to the same as a 2S prefix. On that experience I always assumed they just
dropped the 2S to save space or whatever. 73.

There are a lot of rumours here in the UK about some 10GHz modules used
in the USA in conjunction with GPS and a tractor for keeping tally of
crop spraying, gallons per acre, seeds per drill etc.
The rumours are that the modules are good for Amateur use.
Any substance to these rumours??
If so where do we get them??

Every time I've ever given a small, permanent-magnet DC motor
a spin, it's acted as a generator, as determined by voltmeter,
light bulb etc. I don't know if it's safe to extrapolate to
"any" such motor, but it certainly wouldn't surprise me.

Someone might be able to give you a more direct path to what you're looking for, but unless you get it, I'd start with a company named Navtech. (http://www.navtechgps.com). They sell a very wide range of GPS-related equipment.

It appears that the PMB 2313 replaced the PMB 2312. (The PMB 2313 is now also listed as an obsolete product.) The 2313 data sheet has some applications information for replacing a PMB 2312 with a PMB 2313.

The PMB 2313 will do either 1:64/65 or 1:128/129, depending on the state of a mode pin.

More information is available at:

http://www.infineon.com/products/archive/archive.htm#P

Good luck,

Someone had asked about other alternate sources of power for amplification of Xtal radio audio - here is a delightful little project that really looks like fun - It's called the Pico Turbine, and it is a "table top" version of a vertical shaft Savonius design.

http://www.homepower.com/bonus.htm

"PicoTurbine stands less than 8 inches (20 cm) tall but don't let its size fool you. This version
of PicoTurbine produces about one-third of a watt of power from a direct-drive, single-phase, brushless, permanent magnet alternator. More advanced versions the same

size can produce a full watt, but are more challenging to build."

"The design is naturally self-limiting for over-speed protection. I've left mine out all night
during a windstorm with 50 mile per hour (22 m/s) gusts that made my brick house shake. In
the morning, I looked out my windowï¿½fully expecting to see it "shredded" only to find

PicoTurbine still spinning at top speed in the early morning gale!"

"PicoTurbine is a vertical axis wind turbineï¿½VAWT for short. More specifically, it is a Savonius
design, named after its inventor, S. I. Savonius, who patented it in the 1920s. There has
been much controversy surrounding the Savonius design, as compared to the traditional,
horizontal axis wind turbine (HAWT) for electricity production."

I am pleased that Dieter, Roy, Dale, & Retiredo gave you good responses, Mike. Unfortunately , it appears that your coax might be more useful for your home cable system rather than for amateur radio transmission lines.

651. INFO: Toroid Coil Forms

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-22 00:00:00 UTC
From: lencas0135@aol.com
Message-ID: <19990622193800.15427.00000077@ng-fh1.aol.com>
Source record: 69145

Does anyone know where I can get, CHEAPLY:

Square-Loop, tape-wound, 1 mil., toroids used to make DC/DC Converters?

I am looking for 3.5" O.D., by 0.5" cross section for a 12 to 500 volt two transistor DC/DC converter. I know that I can get them at Arnold Engineering but the one that I want is $109. each.

I want to wind the transformer myself...I have wound many before, but back in the 1960s the toroids were only about $5 each. Amidon does NOT have this type of coil form but they have cheap prices for other toroids...Does anybody know where this particular type of toroid is sold at Amidon prices?

Thanks, Len, WA6ELK

I'm missing something here. Why wouldn't it be useful for an amateur
radio transmission line? Sounds just fine to me.

I just built a ramsey 40 meter kit for CW. I have been trying to tune it to 7.00-7.08 using a National NC-270. My problem is the shortwave stations are so loud I can barely hear the CW. In fact wherever I tune on the band these stations are there. Did I do somethng wrong or is this normal for these kits to have this problem. When I tune to these freqs. on the National, I hear only CW and no shortwave. Any ideas why this might be happening? Thanx Yukon

I was sort of hoping that someone would bring your point up.
(50 ohms vs. 75 ohms for amateur radio transmission lines).

Most people are in the frame of reference that since a 50 ohm transmitter is terminated into a 50 ohm antenna, the "only" way to go is to use a 50 ohm transmission line. However, one can work with balun transformers, taps, and all sorts of neat stuff to use 75 ohm transmission lines. In theory,
a 72 ohm coaxial resonator has minimal loss.
Co-phasing antennas is also interesting to do with a 50 ohm line split into two 75 ohm lines. Thanks Roy,
Al

It sounds like the rig does not have great selectivity. Unfortunately, there
are commercial short-wave broadcast stations that transmit in this
amateur band. I have the same problem with my old Heathkit 101 and
Swan 260 rigs. It is difficult to find a clear spot without crystal filtering or
some kind of special circuit (digital filtering?) to allow a very small
bandwidth to pass. My guess is that your National has a good selectivity,
and your kit can't perform the same way without a major modification. And
sometimes the Ramsey kits don't attenuate the image frequency, which makes the
matter twice as worse. Check to see if the same short-wave frequencies
show up two places. I have no reference material in front of me right now,
but the CHU Canadian time signal might be in this band for you to make
comparisons with.

sounds like sensitivity but not selectivity in the front end. try an
inductive coupling to your antenna instead of a direct coupling, or
tightening up the if fliters or something like that.

I had a "speakered' crystal set in the mid '50's, but lived quite
close to WGN and WBBM near Chicago. I did have to do some modification to
the set, but don't remember what and besides, I probably didn't know what
I was doing anyway. I was probably matching impedances.

==========
I thought the easy way finding out is to connect the coax via a SWR meter to a transmitter on one end and the other end to a non-inductive resistor (carbon) or perhaps a 100 Ohm carbon potmeter.

At lowest possible power allowing for full scale deflection of SWR meter change resistor to a value whereby there is no power reflected (SWR=1) . The value of that resistor is the coax characteristic impedance.

SWR meters are more sensitive at higher freqs ,hence if you have a HF SWR meter use a freq in the 28 MHz band at lowest power level possible. You then likely won't fry a carbon potmeter.

Ensure that coax cable has a good quality soldered connector at the SWR meter end and keep coax connection inner core/screen as short as possible at the resistor /potmeter.

Or you could just not worry about it. Unless you're using a
fixed
frequency with highly optimized tuning, your antenna swr is
likely to
be higher than what you'd get from 75 ohm coax.

>alternators and such.

That's true. NUDETS (Washington-speak for Nuclear Detonations) inside the atmosphere mainly produce the kinds of ionospheric effects I mentioned. (From a radio communication point of view, that is.) They alter the ionosphere in much the same way that a Solar flare does, though more locally. But it can still play havoc with normal skip propagation for awhile.

OTOH "exoatmospheric" bursts (ones outside the atmosphere) are the ones that produce primarily the EMP effect (unless, of course, an important satellite happens to be nearby). What happens here is very interesting. The so-called "prompt radiation" from the burst arrives at the upper layers of the atmosphere at essentially the speed of light. As it encounters substantial density of air, it knocks loose electrons in what as I recall is called the Compton Effect, the electrons sometimes being called Compton electrons. Being in a magnetic field, they don't follow straight lines away from the point of impact but rather fly around and around in a helical path, as a result of the odd fact that the force on a moving charge due to a magnetic field is always at right angles both to the velocity and to the magnetic field lines. This high-speed motion in a helix of course generates radio waves, which travel at the speed of light. But what makes the EMP so nasty is that the incoming Compton electrons are also ARRIVING at the speed of light. So the point at which the waves start getting generated moves downward at the same speed as the waves are propagating. The practical effect is that the energy buildup in the wave continues to be RIGHT AT THE WAVEFRONT! Which means that the wave takes the form of a very sharp pulse wavefront that has a bandwidth of perhaps hundreds of megahertz, and LOTS and LOTS of energy in it.

It is this very sharp pulse wavefront that causes all the trouble. First of all, it can generate many kiloamperes of RF current in a conductor, for a brief moment, and kilovolts or even megavolts of peak voltage, depending on the circuit impedance of course.

Also, the fact that the bandwidth goes out to the VHF/UHF region means that equipment designed for lower frequencies may not have

adequate "bypassing" to deal with the sharp peak. Even HF (3 -30 MHz) radios need to have bypass capacitors with very short leads, as if they were VHF / UHF radios, in order to tame the kind of pulses in an EMP. Not to mention unusually good shielding, parasitic chokes on leads entering the shielding, and a lot of techniques that just aren't normally used in equipment not specifically designed to be EMP-resistant.

For hams, keeping a spare radio in the trunk of your car, or in an underground shelter, or in a metal storage cabinet, might be one of the better ways to have equipment survive.

According to the FEMA consultant whose lecture on EMP I heard some years ago, the peak of the EMP spectrum is estimated to fall at AM Broadcast type frequencies, despite the very sharp risetime. I think this relates to the dynamics of the electrons' helical motion in the Earth's magnetic field that I mentioned earlier. But anyway, any piece of conductor that resonates in the low MHz region, say 0.5 to 3 or so MHz, will pick up the biggest spikes. Short conductors, like the one on your 2-meter HT, may only see a few hundred volts peak. However, even that much could well wipe out the front end of your radio.

>But technology has changed a lot since the 60's. Back then, tube
>technology (which was pretty much 'voltage' amps and high
>impedance) wasn't as protected as a lot of todays technology. Would
>most devices bite the big one? Probably, but they would also be a lot
>of survivabilty that you wouldn't expect.

Most analyses I saw seemed to conclude that tube equipment was MORE likely to survive, simply because tubes are inherently less prone to failure from high-voltage pulses than solid state devices are.

Failures of solid-state devices would probably be quite widespread, but erratic. Indeed some radios would get lucky and survive, perhaps just because the standing wave pattern didn't hit them with as high a signal level as some other radio received, maybe even in the same room.

My impression is that the phone company would come out fairly well because they have historically put so much emphasis on protection against lightning. However, the lead lengths they use from the line to the varistor devices they use for protection would probably be so inductive at VHF / UHF that sizeable spikes would remain. Old-fashioned phones should be fine, but solid-state phones and modems might well get zapped. There would doubtless probably be quite a few "ESS" failures (telco switch computers).

Today the power grid is probably LESS sensitive to a massive overload. The technology for handling 'events' such as lightning strikes is much improved. In that regard alone it might be a neat idea to just contact a power company and ask them how they have changed since the 60's.

Indeed, that would make a fascinating topic for a radio club meeting.
I bet they'd be surprised, though, that you were asking about EMP
rather than Y2K !!!

Incidentally, you might be surprised to find that FEMA themselves would
be happy to send someone out to talk to a ham radio club on both of these
subjects, particularly one located in a large metropolitan area that
would publicize the talk widely.

>I was told a ground busrt doesn't yield near the EMP of an air burst.
>But that's not to say it still won't knock out tons of equipment. Mike

The "exoatmospheric" burst generates the EMP as its main effect.
The less atmosphere between you and the burst, the less of an EMP effect
it would generate because the pileup of the wavefront described above
would have less time to develop. However, rumor has it that there
are now also weapons designed to produce EMP-like effects at ground
level, without using nukes.

If so, I think that's a step forward, sort of the opposite of the
neutron bomb, which kills all the people without hurting the equipment!
Wouldn't it be nice if the human race could learn how to do warfare in
the future by killing all the computers and weapons systems without
harming the people!

Or even better, if we could somehow learn to do WITHOUT warfare at all!

-John S., W3IKG

To put it into perspective, how close should a lightning hit in order to produce a similar EMP as an ionospheric nuclear blast ?

In the days when the NEMP was a hot topic of discussion, you could easily get the feeling that nothing would survive, but from the equipment that I have seen that have been designed to be NEMP resistant, the protection is not that exotic.

It is far easier to find a simple L/C meter----even the little ones for
determining small capacitors and inductors, then go to all the trouble to
find a TDR or other exotic test equipment. Simply measure the capacitance
of any length of coax. Then short the end and measure the inductance.
Use any simple instrument you might have on hand or can borrow.
Then take the square root of L divided by C. This will give you the
cable impedance close enough for any practical ham application. Cliff K7RR

Let's look at what would happen if you used 75 ohm line with a 50 ohm load.

The line would have a 1.5:1 SWR. If the length of the run were such that you had 3 dB of loss if the line were matched, then having a 1.5:1 SWR would result in only an additional 0.14 dB of loss. If the matched loss is 6 dB, the additional loss due to the 1.5:1 SWR is 0.19 dB. So even with a long, lossy, run, the increased loss due to SWR is negligible. (You can find the equations for this calculation in the Transmission Lines chapter of the _ARRL Antenna Book_.)

The impdance seen by the transmitter depends on the length of the line. If the line is an integral number of half wavelengths, the impdance seen by the transmitter would be 50 + j0. The "SWR" (referenced to 50 ohms) the rig sees would be 1:1. On the other hand, if the line is an odd number of quarter wavelengths long, the impedance seen by the rig would be 112.5 + j0, for an "SWR" of 2.25:1. (Don't confuse this "SWR" with the actual SWR on the line. The SWR on the line is 1.5:1 regardless of the line length. The "SWR", with quotes, is the value reported by a 50 ohm SWR meter at the line input. If the line Z0 isn't 50 ohms, as in this example, the "SWR" indicated by the meter isn't the actual SWR on the line, and it will vary with line length.) Other lengths of transmission line will result in values of "SWR" between 1 and 2.25 at the line input, and the impedance will generally include some reactance. A 1.5:1 transformer at the output end of the line would result in the input end always seeing 75 + j0 ohms, or a 1.5:1 "SWR". A transformer at only the input end of the line is as likely to degrade the "SWR" as to improve it. A 1.5:1 transformer at both ends of the line would make the line look like it has a 50 ohm impedance, provided that the transformers are properly designed and constructed (which many aren't). But unless

your rig can't tolerate even a very modest "SWR", there's absolutely no point in using them. Of course, a tuner at the input will also fix the input "SWR" if it's a problem. Or if you're operating on a single band, you can lower the "SWR" to 1:1 simply by changing the feedline length.

A carefully-matched antenna will present an impedance of 50 + j0 ohms only at a single frequency. Also, many antennas, like dipoles, have only one degree of adjustment freedom. That is, you have only one thing you can adjust, such as length. If you adjust to obtain resonance, the impedance at resonance is just as likely to be 75 as 50 ohms, so the 75 ohm line might have even less effect on input "SWR" than in the example. And again, once you move off resonance, both a 50 and 75 ohm line transform the load impedance to some other value, modifying the "SWR" seen at the input. So fussing about what a line will do with a precisely 50 ohm load is often more of an academic exercise than a representation of reality.

The bottom line is that in most applications, you'll hardly notice the difference between a 50 an 75 ohm line. In many real cases, you're just as likely to end up with a lower "SWR" using a 75 ohm cable as a 50 ohm cable.

Source record: 69168

I am modifying an old cb linear for portable 10 meter use, I replaced
two Sprague "Atom" 450
volt caps @ 12 mfd, with two 6 microfarad caps rated at 650volts ac
(reads on the side of the can "ac, and no pcbs"), (what is the dc
rating?.... peak secondary volts?),
Tube is a Compactron 8950, what is the plate voltage of this tube?
I assume it's around 800 volts, since the caps appeared to be hooked in
series.
I bought three MJ2955 pnp transistors from RS
they have the same ratings as 3055, but I don't know ,....with RS,
caveat emptor!,
all mounted on a grounded heat sink.
the original transistors were 2N1522 transistors
and were not even heat sinked! what are these things?
I've hooked the center transistor as a bias control for the feedback
winding to the other two transistors , going to ground through a 25 ohm
(RS) reostadt, should I hook this up as a shunt with a power resistor?
it's only rated at 2 watts, what would be the base current through two
power transistors? I think I need a bigger rheostadt!
Lastly but not leastly where can I find an outboard low-pass filter the
size of a cigarrete pack and able to handle 100 watts?

Thankyou Everyone for your responses, both on e-mail and through this
medium. I'm now waiting for a free day when I will be 'playing'
antenna's.
I would be interested in your comments though on feeding a gamma
matched yagi with this 75R coax. What can I do to transform the 50R
load, required by the commercial tranciever, to the 75R of the coax
and aerial. Its for operaton on 50Mhz at max power of approx 45 watts,
with activity between 50.050 and 50.200.
Obviously the gamma match will accomodate the 75R matching. but I
don't want too much loss in the shack end transformation.

thanks once again everyone 73 Mike W G8NXD

Source record: 69170

Hi,
Are there any books or web pages that show how to use pin diodes to switch radio tuning coils with a microcontroller. It would have to be done in a way that does not reduce the tuned circuit Q factor as this would affect selectivity. If a pin diode is not suitable are there any other methods.

Thanks

Will this actually work (shorting the end and measuring inductance)? Seems like the setup is similar to a noninductive resistor winding (but with the coax it's not entirely symmetrical).

Heh, I hesitate to crank up this flame-troll again, but you CAN just
go ahead and USE the stuff... If you are worried about it's loss,
it can be closely approximated with a transmitter on one end and a watt
meter and load on the other end...
Even if it's 75 ohm stuff, the mismatch will be minimal even if you're
using 50 ohm devices on the ends.
Speaking directly from years of experience, here, as well as
a FEW years testing such concepts with cheesy equipment such as H-P
network analyzers, etc, etc..... minor impedance mismatches are much
overblown in the real world of using what ya got.

Sounds like a fun project. My limited understanding of below-the-noise
signal reception tells me there has to be some sort of correlator involved;
what are you using to implement this? (While you're at it, any tidbits you
want to include on how correlators work will help. :-)

682. Yaesu Help FT-101 Processor Installation

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-23 00:00:00 UTC
From: Jacquis <jaclyn@tiac.net>
Message-ID: <7krvbe$8ok@news-central.tiac.net>
Source record: 69176

Got a processor board for my FT101EE. I can match up the colors from the harness to the board, simple enough ! After doing this there were two pairs of wires on the radio harness (white/yellow & white/gray soldered together the other pair white & red soldered together) Looked like the bypass loop for the rig when it ran without the processor option. Unsoldering these resulted in matching up the white/yellow, white/grey and red wires to those from the board. Now I have a white wire left ! There was no white wire from the board I bought and I was wondering where this wire will call its new home on the board. With just the operators manual I am a little lost since it does not mention the upgrade proc. option installation. It seems the white wire has around +12v on it and the board has a white/orange going to the +12v terminal on the board. The way it is now the unit allows the rig to modulate but without any processing so It must be ok for the most part (since the op-manual describes the circuit as an amplifier in the proc/off position). It does this (but with increased ALC sensitivity) so I am close but no better than without the board. Has anyone installed one of these or can see where the white wire goes to on the pro. bd. in their rig? There is that white wire with a very faint yellow marker connected so don't let this be confused with the plain white. Appreciated any help ! Jacqui N1DVE jaclyn@tiac.net

The reciprocity of motors and generators is based on a fundamental principle of electricity - the interaction between electromagnetic field and electric current in a conductor. It is pretty safe to say that motors and generators are basically the same machine design, notwithstanding some possible optimization in their design and manufacture.

I believe what will happen without the YIG heater depends on whether the PLL has enough capture range to acquire lock on start up. If the equipment runs constantly in a benign environment you might get away with it.

About 8 miles. The inverse square law is still our friend, even with
NEMP.

It isn't. It just has to be done *right*. Same with lightning protection.

This isn't quite correct. When the nuclear device detonates, it generates large amounts of prompt gamma radiation. Gamma is electromagnetic radiation of an extremely high frequency (higher than X-rays), so it travels at the speed of light the same as any other EM. If the detonation occurs in atmosphere, the gammas are rapidly absorbed over a short distance by the atmosphere, generating an incredible heat pulse. The rapid expansion of this superheated air is the primary blast effect of a nuclear device. Relatively little NEMP is produced.

But when the device is detonated at high altitude, there is little sensible atmosphere to absorb the gammas. Instead they encounter the free electrons in the ionosphere. These are accelerated by the gammas, just as they are accelerated by any radio wave encountering the ionosphere (or as the free electrons in your antenna are accelerated by a passing radio wave). But since the gammas are so energetic, and are available in copious amounts, the acceleration produced is *much* stronger, and the reradiated energy as the free electrons decelerate is also much greater.

The free electrons do *not* travel down to the surface, nor do they travel at the speed of light (though they book right along after the initial

acceleration). As they approach the sensible atmosphere, they encounter sufficient air density to be stopped while still many miles above the surface.

Because of inverse square spreading, the gamma wave front will impinge on a large segment of the ionosphere, so the effect is spread over a large area. The reradiation as the free electrons are decelerated is also over a wide area, but bunched vertically in the upper stratosphere as air density becomes greater. This produces a sharp wavefront extended in area. We can treat this the same way as we would a uniform current in an infinitely long wire, so this reradiated field falls off only with the inverse of distance rather than as the inverse square of distance as would be the case if it were a point source. That's what makes NEMP potentially dangerous to our equipment on the ground.

A 20 MT device exploded at an altitude of 100 miles will produce a field strength on the ground roughly equal to that produced by a lightning bolt 8 miles away. But because the NEMP effect occurs over an extended area, the effect is as if there were a lightning bolt 8 miles away in every direction at the same time. The induction will strongly energize extended conductors along their entire length. That's why NEMP is such a threat to the power grid and the phone system.

For the comparatively short conductors we use for antennas and other wiring in our stations, the effect isn't much different from a lightning near miss except that the wave front is steeper, ie the risetime of the induced pulse is faster. So we have to use suppression devices which clamp the pulse much quicker than what we'd need for induced lightning surge. Fortunately, there are gas tubes available which fire in under 2 nS, and that's adequate.

o.k. i want to build a mower engine/car alternator set up , the building i
have no problem with , its the wiring, the alt i want to use is from a skoda (
east europe) i have about 4 whole cars & about 10 in bits so
i have plenty of spares !!!! the alt is tough and large but has a seperate
regulator
do i need this ?? i want to use a battery
and use this set up to jump start cars with flat batterys , run 12v accessories
, but also long term in a power out to power my
shack , (couple of radios) or perhaps a 12v t.v. for the kids etc, etc, i
have i wiring
diagram if i use the regulator if not what then?? i have 1 main feed to the
battery
the other 2 go to the regulator , i suppose
if i do not use the regulator then i run the risk of "battery boiling" but
lot of power
anyway any help would be great

This probably falls into the 'naive question' category, but do regen's receive CW and/or SSB? Or are they basically AM-only devices that are no longer very relevant in this day and age? I ask because i am curious and my intent is not to spark or revisit a long discussion. Let's not get into the re-radiation issue here as i'm assuming a modern design with a pre-amp and suitable construction to isolate the antenna from the partially quenched oscillator.

A stable well designed regen does a very nice job of receiving CW and
SSB signals. All you do is turn up the regeneration just a bit beyond
where the detector starts to oscillate. They work just fine this way.

A multi-use device. A battery is needed with this sort of setup.

> i
>have i wiring
>diagram if i use the regulator if not what then??

Blown up battery and maybe burned out alternator.

> i have 1 main feed to the
>battery
>the other 2 go to the regulator , i suppose
> if i do not use the regulator then i run the risk of "battery boiling" but
>lot of power
> anyway any help would be great

The simplest approach is to duplicate the basic electrical system of the alternator as used in a car. Usually it works like this: Alternator case, battery negative, and regualtor case are all grounded and connected together, by means of wires and/or being mounted to the metal car body and engine. Alternator output goes through a heavy lead to battery positive. There are also one or two leads from the regulator to the alternator. Usually there is some sort of switching arrangement with the ignition switch so that the regulator is cut off when the engine is not running. You can replace this with a simple toggle switch, but remember to turn it off when not in use.

I am sorry, but THIS subject I simply can't ignore.....

There is something about all this EXPENSIVE nonsense
about "STAR WARS" and similar methods of Anti-Ballistic Missile
defenses that grates on me.

WHY are we spending who know how many BILLIONS of
dollars on this ???

There are so many ways the money can be used for helping
people......

OK, here is my reasoning:

1.0 The MISSILE'S function is to deliver the bomb to it's
destination and detonate it when the aggressor nation
want's to kill somebody.

2.0 The purpose of these defense systems is to stop the
missiles BEFORE they can get to their destinations and
detonate their warheads.

OK, fine.

BUT, if I were in charge of being the aggressor, I'd spend a tiny
fraction of the cost of the Ballistic Missile and smuggle the bombs
to it's destination some years prior to the war.

This way, I wouldn't have to develop expensive and delicate
missile systems, just use the same methods drug smugglers have
used for many years.

All that fancy "STAR WARS" garbage means absolutely nothing,
since the bombs are already at their destinations.

SO, why are we wasting our money trying to develop a useless
system ?

I suspect it's due, in part, to the reluctance of the politicians
in charge of military projects to admit to the public that there
IS no defense against this tactic. Well, that, and a tenancy
to want to keep money flowing into programs that help
keep them employed.

Things would be simpler if all the major nations admit that they
have done this smuggling in of weaponry and that there is no
practical defense against it other than the knowledge that the entire
world would go up in smoke if ANY of them started a major offense.

Yep, "MUTUALLY ASSURED DESTRUCTION"

If they all admit to this obvious tactic, then we can stop wasting
money on useless "defensive" programs and use the money
for something constructive.

Like, for example, helping the large starving parts of the world...

Yeah, true, it WOULD require politicians and military types to admit
to reality.... That seems to be a problem with some people.

a regen receiver will also copy NBFM signals if you slightly off-tune the
rx('slope detection')
It may be worth connecting a zener diode across the power supply to the
regen detector stage to increase the stability, otherwise SSB reception may
be difficult.

It isn't. It just has to be done *right*. Same with lightning protection.

What kind of network?

Ethernet is 50 ohms. It's usually marked either RG-58 (if thin, about 1/4"
diameter) or RG-8. (if about 1/2" diameter) It'll work fine.

714. Bi-band mobile antenna ?

Message-ID: <7ksscc$ab5$1@news1.sunrise.ch>
Source record: 69179

Hi...
I'm looking for a bi-band 2m./70cm. mobile antenna (to
buil or buy) !
The problem is that ALL the antennas I've tried were tailored
for the AMERICAN bands, and, as you know, in France our bands are :
144.000 to 146.000 with the center at 145.000 Mhz. and
430.000 to 440.000 with the center at 435.ooo Mhz.
...so, the commercial antennas (made from US bands) ARE TOO
SHORT !!! ...and the whips are too shorts too to compensate for to
resonate on our mid-band !!!
Have you got an idea, or drawings of homebrew antennas, or any
EUROPEAN FIRM who build antennas ?
Please let me know via E-Mail...

I would just mesure the outside diameter of the cable and test for a match
in any Handbook. In a nutshell, if it's a little bigger than Cable TV coax, it is
92 ohm Arcnet or IBM mainframe coax, if the same it's 75 ohm, and if smaller
it's 50 ohm.

Hey folks,

I've been reading "The Joy of QRP" (*great* book) and after reading about strategies
for ideal MUF, radiation angle, skip distance, etc. I began wondering why no'one
(in the HF world, sattelite operation being the exception) seems to be experimenting
with HF antennas where the azimuth is adjustible along with the direction (or maybe
I've just not looked in the right place...).

I.e., what kinds of antennas could be tilted at varying degrees with a rotator to
adjust the skip of HF signals? E.g., if a ground plane for 40M has too low a
radiation angle for the target area one is trying to contact, tilt it back to raise
the radiation angle and get a shorter skip zone???

I've played around a bit with some simulation software, and apparently, the
angle of the vertical radiator of a GP doesn't have much effect in the overall
radiation angle, so the above example wouldn't work too well -- but there
surely must be a number of antenna designs where azimuth control would effect the radiation angle. A 40m Helical?

Being the neophyte that I am, I'd very much like to hear any comments and
ideas that others would care to offer.

Cheers,

Patrick

Hi all....

This is a NO BS NO SCAM DEAL....AND IT IS FOR HAMS ONLY!

My company is 20 years old and we sell computer parts and Microsoft products at
wholesale to re-sellers. There is an even chance you have a product from Amax
if you patronize your local computer shop.

I am a salesman for Amax and I am offering to sell either built systems or
components to hams at the price we sell them in quantity 50 lots to resellers.
This is for real, and so am I.
I am offering this not to make money but as a way to repay the ham community for the TONS
of help I have gotten since I got in this hobby.

Go to www.amax.com and check out the stuff there....

Then call me in the Chicago office at 888-810-2629. I am at extension 106.

Our Illinois location has some pricing at http://people.ce.mediaone.net/amaxil
but it is kinda old pricing. You can call me for deals, but an email to
Doug_Adair@amax.com is best.

725. modifying radio firmware

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-25 00:00:00 UTC
From: Hamish Moffatt <hamish@rising.com.au>
Message-ID: <7kve95$25g1$1@arachne.labyrinth.net.au>
Source record: 69066

I had a browse through the archives of this newsgroup for the past few
years and didn't see much about modifying the firmware of radios.
I'm not interested in extending the receive/transmit coverage but
rather adding some new features.

For example I have just bought a Kenwood TR-9000 2m allmode receiver,
which is about 20 years old. The VFO dial offers 100 Hz steps in all modes,
and 10kHz steps as well in FM mode. I think it would be nice to select
the step size (eg 1kHz steps would be useful); the memory selector switch
(5 position rotary) could be used in VFO mode to select the step size.
The schematics shows all these switches go straight into the micro.
The micro is a "uPD650C-021".. is that a real 6500, or is it a 6502?
Since the ROM seems to be built in to the micro, that's going to make
things a bit harder though. I don't want to write firmware from scratch.

Similarly my Icom IC-726 HF/6m rig would be enhanced (IMHO) if you could
make the VFOs track when in split mode, eg moving one would move the other
by the same amount. This would be useful for 10m and 6m repeater operation,
perhaps satellite too. The 726 contains an "HD63A01Y0RK10P", which also
appears to have the program built in.

So has anyone done anything like this before? It looks like a bit of
a dead-end to me at present, since I doubt there's any way to read the code
out of the micros, and probably no way to obtain a replacement chip to
program up (especially for the TR-9000). I don't suppose ICOM or Kenwood
are likely to want to give me the source code, either.

I suspect the micro in the 9000 could be replaced with an FPGA (custom
PCB required etc, of course) but I don't think I'm that keen.

My experience has been that "nice looking cable" is almost
always
50 ohms. But there was that one time that I got some pretty
nice
looking cable that was 75 ohms. Oh, then there was the
surplus
stuff that was 93 ohms...but it wasn't quite as nice looking
as the other, so maybe that didn't count...

Seriously, cable should have a number written on it.
Publish
that and ask again.

Here's a thought experiment.
Assume your L-meter measures L by applying a sinewave of
some
frequency to the device under test. We don't care how it
actually
determines the inductance from this sinewave.
Now take a piece of coax that's 1/4 wavelength at the test
frequency.
Short the end. The other end looks like an open circuit at
the
test frequency. I don't understand how one could possibly
make
an inductance measurement at the test frequency on that open
circuit.

Now if the coax is relatively short compared to the
wavelength of
the test frequency, you'll measure something. In the limit
of
"very short" you get something close to the right
inductance,
but it will be a small inductance requiring a meter capable
of
measuring accurately in the hundred nanohenry range.
What's wrong with this picture?

TDR is NOT exotic. All you need is a pulse source...you can
do it
with a TTL gate...and a scope. You need enough coax so that
the
transit time is somewhat longer than the scope risetime.
Hang a small
potentiometer on the open end and tweek until the reflection
goes
away. Then measure the resistor with an ohmmeter. It's
very
accurate. And the required scope is probably cheaper than
the
LC meter required to do it by the sqrt(L/C) method.

I had a scope long before I had an inductance meter. And I
still
don't have an inductance meter capable of accurately
measuring low inductances.
My cheapo LC-meter is
about 4 orders of magnitude shy on required inductance
range.

So you really want to get serious about embedded programming, eh?

You should know that many embedded uP chips are designed so that their
internal ROM chips can not be read from the outside.

And source code? I don't know. I suspect that even if you could get
it, the comments and documentation are all too likely to be in another
language, such as Japanese. It seems to me you are asking if anyone
has reverse engineered these radios.

My suggestion is to try building your own from scratch. You can
purchase DDS kits, front end filter kits, receiver kits, and even
transmitter kits. With a bit of extra glue (a handful of switching
diodes and transistors) you could then insert your own uP. And you
could use whatever uP you like.

This sounds like a lot of work, but reverse engineering can be worse.
Frankly, considering the performance compromises one finds in the
radios you mention, I'd seriously consider starting with a clean sheet
of paper.

Sure do -- just advance the regen control far enough to bring the detector into oscillation and you've got your local carrier. The QRP-L list seems to be having a regen revival lately, and on the glowbugs (tubes) list regen design and use is a staple topic.

Your right about that! I've been designing microcontrol systems for 10 years and every once in a while we get some company with legacy hardware that was designed by some out of buisiness company and they want us to reverse engineer it so they can "modernize" the design. Usually we spend about a week trying to run down old chip data and firmware code from defunct companies and invariably wind up designing a brand new system from scratch.

However all is not a lost. You can try the old "monitor, modify and replace". This can take a lot of time but it can be worth it. What you do is look at all the I/O lines and determine wether they are input or output then you monitor the output lines while you change the state on the input lines (obviously it is a

bit more complex than this but you get the idea). Once you have detemined the purpose and operation of all the various I/O lines you can then rip out the old microcontroller and its peripherals and install your own. In most cases a single well chosen Microchip Pic can replace most if not all of your present control system.

Basicaly what you do is maintain the integraty of the old controlled system (in this case the radio) but have replaced the controller with a system that is, to you, more user friendly. Bare in mind however that this is pandora's box, once you've torn out the original controller there is usually no going back. If you've made a mistake in determining I/O function or lose an important bit of information your stuck with a nice 2m paper weight.

<snip>

I've always held the opinion that reverse engineering isn't worthwhile
unless there is a very large market of these things in use and it is a
de facto "standard." For example, the IBM personal computer in the
early 1980s.

It's also worth noting that many PLL chips take their data serially.
Unless you know the chip, you're going to have a great deal of fun
figuring out how it works, particularly if it only has a house number
on it. I think we can all see this is not a simple effort. I'm sure
someone has done it once upon a time,

Finally, reprogramming all this, from the control panel buttons and
knobs, to the PLL chip commands, is quite a formidable task to be
undertaking from ground zero. And as you pointed out, the opportunity
for error is quite high.

For most radios, I just don't see how it is a worthwhile endeavor
compared to starting with a totally new design.

Hi. I`m looking for some good drawings on 2/6/70cm transverters.
I`m going to use my ts940 to drive them.
The 2/70cm transverters should be good enough for EME.
If you got drawings on preamps for the above, that`s also nice.
I`ll cover the postage if you got it on paper.

>
> Can anyboby help?

"The XR-1468/1568 is a dual polarity tracking voltage regulator, internally
trimmed for symmetrical positive and negative 15V outputs. Current output
capability is 100 mA, and may be increased by adding external pass
transistors. The device is intended for local 'on-card' regulation, which
eliminates the distribution problems associated with single point
regulation."
...
"Outputs are internally set to +- 15Volts but can be externally adjusted
between +-8.0 to +-20 Volts with a single control. The circuit features
+-100 mA output current, with externally adjustable current limiting,
and provision for remote voltage sensing."
...
"Output Voltages Balanced Within 1% (XR-1568)" (looks like 2% for 1468)
"0.06% Line and Load Regulation"

Looks very simple to use. Ground pin 1, hang 1500 pF caps from 3 and 12,
sense resistor from 4 to 5 and from 10 to 11 (take power from 4 and 11),
+V to 7 and -V to 8. 2 is "balance adjust"; in sample circuit, 2 to wiper
of a 100K pot whose outside ends go to 4 and 11. 14 is "voltage adjust";
in sample circuit 14 to wiper of a 100K pot, outside ends to 4 and 11.

Only two pages in the (1985) databook.

To be more clear on the output connections, 5 and 10 are the actual chip
outputs, 4 and 11 are the sense inputs. They hang 1 uF from 4 and 11 to
ground in sample circuits. Can't find any data on sizing the sense resistors,
no values given in sample circuits.

The 726 HF/6m seems to be a very good unit. However, the VFO in the
TR-9000 2m does seem to be very odd indeed (there are big jumps in
actual frequency between 144.099 and 144.100, for example).

Thanks.

Grab up an inverter and just invert the what is present at the squelch
signal. If a low is presented to the invertor it will output a high.
You may have to find a 5 volt source or install a regulator to
accomplish this along with the invertor.

That seems like the most likely option. Even if it were possible to
get the code out of the old micros (unlikely), being able to get another
device to program with replacement code is going to be very difficult.

I suspect the micro functions in the 2m TR-9000 are very simple and that
an FPGA could replace just the micro itself -- make a PCB that plugs into
the micro socket so that it would be possible to undo any
mistakes!

Thanks Rick,

There are two things influencing the radiation angle of HF antenna. One is the elevation, the other (in case of vertical) is the conductivity of the ground (number or radials or the structure of radioa system. Adjustable hight might be difficult to achieve, but some sort of adjustable radial system might work.

Haven't tried that, it's just an idea.

Thanks a lot Cliff!
THAT I remember: the sense resistors were calculated for a drop of 0.6 volt
(one diode drop) at rated output current, and were 330 ohms

for an unamplified 1468. My version was amplified with a 2N3035 and a
TI 3027 (PNP), and had 0,33 ohm sense resistors. I was 9X5PT then (1975)
quite far from any suppliers and I don't recall if it EVER worked...
I'll remount it barefoot and if it doesn't I still have another in the original
XR packing, but that time I'll use a SOCKET!

Thanks again for your help!

750. Re: EMP phenomena (was: Morse code)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-26 00:00:00 UTC
From: Dave Shrader <dshrader@earthlink.net>
Message-ID: <3774AA6E.33853DAB@earthlink.net>
Source record: 68994
Cross-posted to: rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

EMP will generate a very broad area of coverage. A high altitude explosion will produce 50,000 volts per meter over a 1000 mile radius.

The energy spectral range is different between lightning and EMP. Lightning does not have the fast rise time of EMP and therefore lightning EM energy peaks in the range of LF to MF . EMP, as mentioned earlier, has measurable components out to 800 MHz, but peaks in the MF to HF range depending on weapon design and altitude of burst.

Ground burst EMP exhibits a different characteristic. The nuclear x-rays are absorbed within about 10 feet of the blast center and they produce tremendous heat and EMP. The electrons, due to the earths magnetic field, rotate and curl into the earth as opposed to transiting in a longer space path. They produce a radial field. The nuclear prompt gamma rays, much higher energy photons, require about 1 mile of atmosphere, at sea level, to complete their absorption in the atmosphere. It takes a longer time for photons to travel a mile, so you get a broad pulse width.

All together, nuclear EMP produces about 50,000 volts every ~40 inches with energy peak spectral density in the 1-10 mhZ range. Lightning produces about 20,000 volts every ~40 inches with a peak spectral density in the 0.1 to 3 mhZ range.

Both are very nasty. We have all read about lightning damage to antennas and equipment in these groups. It will happen if ever there is a Nuclear induced EMP event.

Could this be clarified please ?

Is the field strength 50 KV per meter at a distance of
1000 miles from the explosion?

If not, where *does* the 50 KV per meter occur ?

Reg.

753. DR-610tq Mod Question ???????

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-26 00:00:00 UTC
From: n3taw@aol.comAntiSpam
Message-ID: <19990626090802.13958.00003989@ng-fq1.aol.com>
Source record: 68997

I was surfing some mod pages, And I started looking
at the mods for the DR610. For curiosities sake, they
show that the vhf area open up for TX/,
But the UHF TX does not open up. Is this the case or
was that info about the uhf TX range left out by
acccident. From what I have always seen both
end open up.

Puzzled ?

Mark

I'm not familiar with either of your radios, but would it be safer to your equipment to make them serial-pc controllable and then tweak on the interfacing software? Software is so much easier to undo.

I've been considering buying the Fireball 40 from the NJQRP group..
It's only $10 shipped.. Still looking for a reciever though.. One
that'll fit in an Altoids tin to look similar to the Frieball 40..
Already got a line on an antenna tuner for it too for $25 shipped.
Take the one guys advice and look at some of the qrp websites.. The
NJQRP club has a lot of good links to qrp sites.

Anyone know if there is any info on the web about solid state tube construction? I know that there were a couple of articles in QST years ago (or was it 73?) ... I lost my last photo copy of the article - and the MOSFETs in the article weren't readily available anyway. I've got a Drake R4b that needs a coouple of non-gassy tubes and I thought I'd give solid state replacements a try.

You are talking about the elevation or zenith angle.
The azimuth angle is that around the clock in a
horizontal plane.
Usually the problem is the opposite: how to get a lower
angle to have
a bigger jump.
The idea, maybe, would work with a good beam antenna,
but it shoud be very hard
to control it also in the vertical plane.

> Firstly, why post with a bogus reply address?.

Firstly, to eliminate SPAM. The text in the reply address
cannot be mistaken for a legal address and
clearly tells you how to click elsewhere in the sig to
reply.
This method is working extremely well on spam.
If you're browser challenged, I lose.

> Secondly, If the coax had had a number/ident on it I would'nt have
> needed to ask my fellow / peer amateurs in the first place.

Secondly, "nice looking" gives absolutely NO information
from which
to draw a conclusion. In the US it would be difficult to
get the
inspectors to approve installation of unmarked anything.
Maybe that's
why it was available. Sorry for asking the obvious.

> Thirdly, Thankyou for your input :-)

Thirdly, you're welcome.

Send me a foot of it and I'll TDR it for you. Actually need
only about
an inch or two if it's got a connector on it.

769. Yaesu FT-2700RH 2m/70cms FM transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-27 00:00:00 UTC
From: Frank Dinger <frank.dinger@zetnet.co.uk>
Message-ID: <19990627234150704 32@zetnet.co.uk>
Source record: 69013

To those homebrewers/repairers who require parts for Yaesu FT-2700RH
2m/70cms FM transceiver

The Sutherland & District Amateur Radio Club (SADARC) located near
Golspie in the north of Scotland , has been donated a faulty
FT-2700RH transceiver to repair other equipment using some of its components.

The 2 RF Power modules and casing have now been used ,but all others
components are still available ,perhaps to others who no longer can
get components/sub assemblies to repair their defective unit.

These components are now available for the cost of postage plus a
donation to SADARC.

Some items :
+Loudspeaker 8Ohms - 2Watts flange size 80 x 80 mm

++Front panel with display circuitry complete with knobs (complete
sub-assembly)

+++Tx board

++++RX board

+++++Lithium back-up battery on control board (micro processor is defective)

Apart from the loudspeaker , no components can be garanteed OK ,
although the risk of being defective is low.
The unit had to be scrapped only because the defective microprocessor
is no longer available.

For enquiries you can contact :

Secretary SADARC
Inver by Tain , Ross-shire IV20 1RX - Scotland UK

e-mail : gm0csz.kn6wh@ukrs.org

774. Re: Azimuth control for HF antennas?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-28 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <3777FC93.6EDA0CF0@teleport.com>
Source record: 68932
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.homebrew

A Yagi with a reasonable number of elements for HF has a broad elevation pattern. The angle of maximum radiation is determined primarily by the height of the antenna (which determines the phase between the field direct from the antenna and the one reflected from the ground), not the tilt of the antenna. Tilting the antenna has almost no effect on the elevation angle of maximum radiation. This is true of any practical HF antenna.

If you mount an HF Yagi with the elements vertical, you'll take a bad beating at low angles due to ground absorption of vertically polarized fields unless reflection is off salt water. It would be interesting to see the effect of tilting a long vertically polarized Yagi over salt water, but my guess is that antenna height would still be the chief determining factor of the angle of vertical radiation.

You could improve radiation straight up, or at very high radiation angles, by tilting a beam to a vertical, or near-vertical position. But the only way to make an appreciable impact on radiation at low angles is to change its height.

Roy Lewallen, W7EL

From: technolad@webtv.net
Message-ID: <27265-3777F7BA-81@newsd-232.iap.bryant.webtv.net>
Source record: 68933

Well whatdya know,.. my pnp transverter worked! although I'm still drawing 5 amps @ 6 volts, and my power supply shuts down prematurely. the secondary only has 60 volts on it... At 12 vdc it will be running over 15 amps! what a little monster! ..this makes me think the plate voltage of the tube is rated a lot lower than 800 volts! It would be better to replace the tube with a power mosfet and run it at 50 volts or something.
The bias transistor only passes 10 to 20 milliamps with 25 ohms in series with the 25 ohm rheostadt. so I can hook the linear to 12 vdc and use the bias control using a ten turn pot if I wanted to, instead of having to buy a 20 amp variable power supply for testing purposes.
If the plate voltage of this tube is only around 100 volts or so, why not just go out and buy one of those ferrrite inverters from RS?
I haven't hooked up the filter caps yet so as not to get zaped! I'll have to wait till I can afford a pair of 3-400z's before I do that!

776. Turn your PC into a DSP

I am a professional software engineer and a long time short wave
listener.

I have developed a Windows program that allows you to filter audio in
real time.

Connect the "Line Out" on your short wave radio to the "Line In" on your
PC's sound card.

Use the Windows "Volume Control" program to assign inputs and outputs
and set levels.

The program takes the digitized audio, filters it and plays it out
through your PC's speakers!

No special hardware or modifications needed.

It does require a fast PC - 200 Mhz or better.

For more information and a free Shareware copy of the program visit my
web site:

http://www.winternet.com/~swezeyt/dsp.htm

Thanks a lot,

777. Re: measuring feedpoint impedance?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-28 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <3778034C.3AFD5086@teleport.com>
Source record: 68935

Some of the newer amateur antenna analyzers (by MFJ and AEA) can measure the complex feedpoint impedance of a single antenna, or you can use an impedance bridge such as ones made by GR, or the more modern ones by HP. (Older GR units are commonly available for a few hundred dollars; most HPs are much more.) Measuring the feedpoint impedance of a single element of a phased array would be much trickier, and a good method using simple equipment doesn't come readily to mind. I use modeling to get the impedances of phased array elements.

Source record: 68936

There are a couple of things you need to know. One is the peak voltage out of the rectifier under full load. The other is the minimum voltage the regulator requires. For example, suppose you have a transformer rated at 12 V RMS at 1.5 A. The peak AC voltage from this transformer would be 12 * 1.4 = 16.8 V. If you use a bridge rectifier, the diodes will have a drop of roughly one volt at 1.5 A, and there are two in the path, so the peak voltage from the rectifier would be about 16.8 - 2 = 14.8 volts. This is the first value you need.

Most 3-terminal regulators require 2 to 3 volts headroom, that is, the voltage at the regulator input has to be 2 to 3 volts greater than the regulated output voltage. So using 3 volts, you need 9 + 3 = 12 volts at the regulator input. This is the second thing you need to know.

The capacitor will charge to the peak value of the rectified input during each half-cycle of the AC waveform, and discharge during the rest of the cycle. The difference between the highest (peak) voltage and the voltage just before it's recharged is the ripple, and the larger the capacitor the smaller the ripple. For this example, you need the capacitor to be big enough that when charged to 14.8 volts, its voltage won't droop below 12 volts. In other words, the maximum ripple you can tolerate is 2.8 volts.

The ripple voltage is approximately V = I*t/C where

I = the discharge current in amperes
t = the time between charge intervals in seconds
C = the capacitance in farads

or C = I*t/V

t = 1/2 of the mains AC period for a full-wave rectifier like a bridge. For 60 Hz mains power, t = 1/2 * 1/60 = .00833 sec. For this example, I = 1.5 amps, and V = 2.8 volts. Plugging these into the equation, C = 0.0125 F = 12,500 uF. You can see that using a transformer with higher voltage will reduce the size of the capacitor required, but this will also increase the regulator's power dissipation.

If you're going to buy the capacitor, I recommend sizing it a bit larger than what you calculate, to allow for errors in the estimation of various values.

Indeed. That was its real purpose. The West knew it could outspend the East, and that the East would bankrupt itself in an attempt to compete. This showed a nice grasp of human nature which overshadowed any technical merits or demerits of SDI.

There were some nice spinoffs of SDI in the areas of adaptive optics, supercomputing, and high power lasers, but it was never realistically assumed to be a real defense against nuclear weapons. The concepts of castles and moats are dead when faced with the power of the atom.

Cute, but no cigar. The radio has to work when there's power from a
radio station, not when there's power from a wind.

Again, my advice is to start with a clean sheet of paper. You might
try watching the QRP-L e-mail reflector. Those folks build a lot of
their own gear, can refer you to kits, and even discuss playing with
firmware on occasion. Some have constructed things such as a simple
DDS VFO which includes a morse keyer on the controller chip.

I suspect your synthesizer may be switching something with the
reference. Does it do this every 100 kHz?

Indeed, it may have worked for you, a conspiring member of
a very small world population minority, including North
American citizens like yourself. But it does not work for
by far the great majority of the world's population. It is
they who have been robbed.

But, of course, the remainder of the world's very sensible,
intelligent, better educated population do not expect you
to admit it. It goes against normal human (aggressive)
nature. So don't worry about it.

Every 10 kHz, actually. The synthesizer is accurate to 10 kHz, and
a VCO (controlled by a D/A converter connected to the micro) is mixed
with the synthesizer output to give 100 Hz steps. It needs calibration,
I'm told.

Hi Dave,
Do not worry, there is some defanse.
You must made rotating high-frequfency shield.
You can made it with tree of Tesla's coils.
Every secundary put on next primary, and made one circle.
Everything must be in resonantion state (all of coils).
All the best,
Proka

If the output of the monostable is unipolar, then a true integrator
would just ramp up forever, right? I suspect the RC is really a low
pass/averaging filter in this application - and, yes, the linearity ought
to be terrific.

Source record: 68949

The smoothing capacitance must be large enough to limit the peak-to-peak ripple voltage to some specified low level at the maximum DC current drawn from the supply. The following formula applies to a 60Hz power frequency and a bridge rectifier.

C = 1,000,000 * Amps / 120 / Vr

where C is capacitance in micro-farads,
Amps = Load current in amps,
Vr = peak-to-peak ripple volts across capacitor.

So in your particular case, with a maximum DC load current of 1. 5 amps, to limit the ripple voltage across the capacitor to, say, 1. 5 volts pk-pk -

C = 1,000,000 * 1. 5 / 120 / 1. 5 = 8, 333 micro-farads.

Nearest preferred value is 10, 000 uF which is a typical value for your size of power supply. It is not a particularly critical value.

The capacitor should by of a type designed for rectifier reservoir capacitor service. It has to cope with a higher RMS current flowing through it than an ordinary de-coupling capacitor.

Note that for a bridge rectifier the factor 120 is just twice the supply frequency. If a single-diode, half-wave rectifier is used the factor becomes 60 and a capacitor of twice the value is required for the same amount of ripple.

Note that the peak-to-peak ripple voltage is at a frequency twice the AC power supply frequency and is twice the peak deviation of the ripple above and below the average DC voltage across the capacitor.

BTW, has anyone seen those Wind Up radios for sale? They are sold somewhere but I haven't seen them in a catalog or on a store shelf. I saw one guy using one at a cosntruction site, and he wound it up a whole lot and I guess it ran for ten or 20 minutes on a single windup. Pretty neat. Saved a lot on batteries.

One old German guy that works here said that in WW2 he had a flashlight that had a generator that was powered by squeezing the handle. I think I've seen something like that in an outdoors company catalog.

I've often thought it would be interesting to see an all-digital version
of such a scheme. With a few ECL chips, a fast clock, and a
high-quality 16-bit audio DAC you ought to be able to build God's own FM
demodulator. You could even demodulate subcarriers, stereo, etc.
entirely in the digital domain.

Ahh, you're a task master! OK, how about tuning in "natural radio" frequencies and using that for the power source (as in a second tuner for rf configured to tune vlf elf instead of
BCB)?

Bob grove advertises them in Monitoring Times Mag, and his catalog, Grove enterprises, and probably on his web site www.grove-ent.com. Wind up, with light, and clear!

Me too, even inexpensive ones (probably a bad idea) in surplus outfits like Alltronics, Electronic Goldmine, etc. Now, what if someone put one of those little "hand squeeze generators" together with a couple of computer memory caps (2-5v, 1 farad) and a number of those new, 'white light' LEDS that cave explorers are talking about? Lifetime flashlight?

> . . .

Let's see, guessing that the radio takes about 10 mA at 6 volts to run, a set of alkaline AA cells would last about 150 hours. I seriously doubt that he's cranked the radio enough to run for 150 hours, so he's saved less than $4.00 at drugstore prices. (I get AA alkaline cells at Price-Costco for about $0.25 each, dropping the savings to $1.00/150 hours.) Wonder how much more he paid for the radio than he would have paid for a simple battery-operated one. Alkaline cells will easily last 5 years in storage, or much longer -- 10 years or more -- if they're not allowed to get too hot. A set or two in the refrigerator, or even stored with a radio, are very good security that you'll be able to listen to the radio in any emergency.

There are places where batteries simply aren't available (but the crank-up radios are?), and the crank-type radios might be practical in those locations. But if you get one to save money on batteries, first subtract the cost of a battery-operated radio from the cost of the crank-up version and see how many hours you'd have to crank to make up the difference. Happy cranking!

The simplest way to figure out the size of filter caps is to look them up in a catalog. Normally the physical dimensions are given along with the voltage and capacitance ratings.

Usually the small size for value. In your application I do not see why any tupe will not work. The caps need to be very close to the regulators. About an inch or two at the most is the specification to prevent the regulators from going into oscillation for many of the regulators.

Tantalum capacitors are physically small for a given amount of capacitance, and they have a very low equivalent series resistance (ESR). (They're also quite expensive.) It's the first quality that's most important for the application you mention, because smaller size means less inductance, so tantalum capacitors are more effective bypasses at high as well as low frequencies. Modern miniature aluminum electrolytic capacitors will be fine for this application, though. Be sure to keep the leads very short and mount them very close to the regulator. Without them, the regulator can oscillate.

Evidently you don't know anything of economics or the workings of a capitalistic economy... Money MUST be spent for the economy to survive, and LOTS of money must be spent for it to grow.

From college economics of the 60's, I recall that "a dollar spent generates seven dollars" by the time it has circulates through the economy. Who knows what that figure is now? We MUST have huge spending projects such as the B2 bomber at a $billion per copy and other huge spending projects which integrate "high tech" into--and keep it in-- our everyday economy in order for the economic expansion required --no, DEMANDED-- today to endure. Examples are HDTV, the personal communications explosion and Star Wars, to name a few. Forget giveaways to foreign countries, tho it's sure they will continue unabated, but those dollars do nothing for OUR economy. The dollars spent HERE are what counts.

W0EX

So why do US citizens refer to themselves as 'americans' ?

They do not yet own the whole continent.

After all, Cubans are americans.

823. 1.2GHz and up uWave Circuits (now for the real work)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-06-30 00:00:00 UTC
From: slug@aeminium.ddns.org
Message-ID: <7ldb7jbgr1@bbs.aeminium.pt>
Source record: 68884

Hello,
about 2 months ago i posted a message concerning microwave circuits
and receive 2 replys, one from David Feldman. I received the minicircuits
catalog today and want to start working on circuits about 1.2 GHz (amateur
band) and 2.5GHz (ISM band for a university project). But were to start?
First, how can i make the microstrip PCB's , ie, how can i know the required
parameters, etc. I'm a complete newbie, so please help! I can make PCB's
using the UV method (done many, digital and to about 200MHz simple RF).
Someone also mentioned a program called spuff i think, but i haven't
bought it, since i don't know what the purpose of it. I'm a linux user, and
for simulation there seem to exist good simulations circuits (i have the
aplac demo and enjoy it very much) and if required i can make one for
calculations myself.

I was thinking on starting with something like this:

```
uW VCO ------------ > uW MIXER---------> AMP ------> Antenna
/|\
|
|
Audio -----> LO VCO -------/
```

You could tell me: why don't you apply the audio to the uW VCO? Well
I want to use a mixer on the microwave band to get the feelling of it and
on the 2.5GHz project i need to use one, on the TX and RX side.

And for the receiver something like this:

```
-------->Antenna-------> uW MIXER ------>PLL------->Audio
/|\
|
uW VCO
```

Ok, now your opinions:

-Would this work without much effort?
-Advises,ie, which mixer, vco, etc should i buy,ie, which parameters
should i be aware off (TX mixer LO min dB, RX low noise mixer, etc)
-how to glue the thing up, ie, RFC bias, how to make the PCB, how to
make the RFC (using microstrip or a simple inductor?), etc
-microstrip filters, antenna, etc...

Now the litterature?
I have the following books:

- MicroStrip Antennas (I.J.Bahl)
- Microwave Antenna Theory and Design (Samuel Silver)

- Stripline Circuit Design (Harlan Howe)
- Microwave components, Devices and Active circuits (Paul Combes)

I was thinking on buying some books from ARRL, what do you suggest?

Thank you very much for your patiente,

Nuno Sucena

Iron core transformers designed to be operated from sinusoidal waveforms do not take well to truncated waveforms. Why not just salvage a variac and put that on your primary? Or, were you looking for something that could be controlled externally?

Doug Moore

825. Where to buy electronic components - online?

Hi,
I'm looking for Three 'hard to find' electronic parts.
They are:

Hitachi 3sk309
Motorolla MRF9820T1
HP HSCH-9161

Can anyone suggest where the best www site is to
buy these items?

Thanks in advance.

I have a story about that. Some years ago I was getting ready for Field Day, and discovered that the fuse holder in line with my battery had broken, as they do after a while. I didn't have a replacement on hand, so did without the fuse. Of course, that was the year I connected the battery to the rig backward. The wire to the battery (a 5 Ah sealed lead acid unit) immediately began smoking, and the wire separated from the insulation. I managed to disconnect the battery before a fire started, but burned some holes in the bottom of the tent where the wire had landed.

I had put a 3-watt diode across the rig's power terminals, which would have provided protection had the fuse been in place. Based on the forensic evidence, what happened was that the diode had gotten hot enough to melt the solder at its connections, then finally fused. When this happened, the reverse voltage was applied to a small, dipped tantalum capacitor which was also across the power terminals. It went short, and remained so. The short, as you say, had a very low resistance, and there was no sign of heating of the capacitor despite the several tens of amps which flowed. The tantalum capacitor turned out to provide better reverse-voltage protection than the diode! Needless to say, the fuse is back in place in the battery line.

I've seen a small shorted tantalum happily current-limit a 3 amp supply. If one ever does get supplied enough energy to heat it, it can catch fire. They can occasionally fail when the correct polarity voltage is applied. But even a very small reverse voltage will very noticeably increase the chance of failure, and a high reverse voltage will just about always make one go short.

I have successfully used inexpensive "Light Dimmer Controls" to control the input voltage to a power transformer,
most recently as a screen supply for a 4CX250B push-pull VHF homebrew amplifier.
At the low end there is little or no control, then about midrange it "kicks in" as the transformer begins to
draw sufficient idling current to make the SCR work better in the "light dimmer".
I used lots of C in the filtering of the output, never experienced any hum or weird noises with this method.
The effective control range, however, is rather limited and on the upper range of the knob's turning radius.

Just for fun I improvised a pulse-counting discriminator in
software and fed it some data that flipped back and forth
between 1500 and 2300 Hz (I've been playing with HF WEFAX
a bit lately...). The results looked good, and were dead
simple to implement...another algorithm for the DSP arsenal,
methinks.

Speaking as a total idiot when it comes to economics: What kind of BULL is that? Inflation aside, as far as I know, wealth is not created or destroyed, just redistributed. With a trade deficit, the only meaning I can infer from your statement is that each dollar inflates 700% by the time someone gives it back in taxes.

This doesn't feel right, so please explain.

Michael.

Trog:

I now have a PWM regulator "boost circuit" using an off the shelf (LM3524) to control the duty cycle (I've built a few prototypes with other chips - same idea). I can control the duty cycle of the PWM with a DAC - that's easy enough. The supply, however, must always face a load since the required value of inductor being pumped is inversely proportionate to the load. So I am going to be generating some heat anyway.

I guess that if I dusted off my knowledge of linear programming and optimization I could figure this out, but I did state at the outset that I am lazy.

Since there are no free lunches, and I do want isolation between the mains and the HV I have to use a transformer anyway. It seems just as simple to use one of the old HV xfmrs lying around in the junkbox rather than one of the newer LV xfmrs lying around in the junkbox!

In effect, the frequency that the filter caps see will be higher. That iron core, as you suggest, however, is not going to like to collapse it's magnetic field quite so quickly and I am trying to figure what is going to be reflected back.

I am kind of regretting giving away those 400Hz transformers.

I recently asked a similar question, and ended up using Duco cement to hold a VFO toroid in place.

It seems to work OK. I've hauled the radio out into the field, and made a bunch of QSOs in European Field Day a few weeks ago... The thing is just as stable as the "big rig", both long-term and short-term and both against vibration and heat.

So why do US citizens refer to themselves as 'americans' ?

They do not yet own the whole continent.

After all, Cubans are americans.

U.S. citizens? The proper name of the country is the United States of
America. How they refer to themselves is irrelevant. Your implication that
all use this moniker and that by this use there are no other Americans
outside of the USA is silly

You forgot Canada (which by the way has far more land mass than the USA),
all the various sovereign Indian nations, Haiti, and Costa Rica to name a
few.

Keep trying, you'll eventually get it.

One thing you can try for things like HP and Motorola is to go to their web sites and see if they point to distributors. A lot of distributors now take small credit card orders, though many do still have a minimum, or a minimum shipping charge that could cause some pain.

I'd think that most folk here would already know about Mouser and DigiKey, and there are a few other places that have things like "replacement parts" in the Japanese transistor series. There are also a couple places at least that specialize in RF semiconductors (both low and high power). Do a web search? Look in the ads in magazines like "Electronics Now"? Maybe someone will post some favorites.

I know that answer is kinda vague but maybe it'll get someone pointed in a direction that leads somewhere.

Cheers,
Tom

I can provide you with the name and address of a firm in Toronto Ontario
who sells these if you want. Theyre made in South Africa and had a great
application there because of no power in the little villages etc. One
model in addition to the wind up has a solar panel too. Very neat, well
made - they are sold under the name of Baycom.

Tantalum caps have lower ESR than the same size elecrolytic cap. In old databooks National Semiconductor (a mfr. of LM338) used to say it took 25 uf of aluminum electrolytic to be as effective as a 1 uf solid tantalum, if memory serves me correctly.

Baygen, I think the inventor's name is Trevor Bayliss. You can also rig
them up with rocks hanging on string wound around the handle for
extended play. I had heard that they're working on a wind-up PC as
well. Not WinTel, presumably?

Cheers

A solar powered flashlight! Now there's a novel idea! I think I've seen
them for sale right next to the battery operated dinner forks, and the
razors with two safety edges.

Several responses about tantalum capacitors (lower ESR, etc.) are correct.
Additionally, electrolytic capacitors lose much of their effective capacitance
at cold temperatures [this may not be a problem with your appliction].

One additional caution: solid tantalum capacitors occaisionally fail (as do
all components). When they fail, they fail shorted with incredibly low series
resistance. You need to be sure that you have adequate over-current
protection (or a fuse) feeding the capacitor, or you will burn up PC board
traces,
or perhaps worse. If you are bypassing the output of a series-regulator, make
sure the regulator has over-current shutdown. If the tantalum capacitor is
across a battery, make sure that there is a fuse between the battery and the
capacitor.

or perhaps worse. If you are bypassing the output of a series-regulator, make
sure the regulator has over-current shutdown. If the tantalum capacitor is
across a battery, make sure that there is a fuse between the battery and the
capacitor.

I have a HAL P38 - and it had a tantalum across the +5VDC supply that failed.
It was able to drag down the +5V 30A supply in the PC without blowing up any
traces
or board connectors. It stayed that way for several days I was gone. When I
returned
until I noticed the awful smell and noticed that the PC wasn't working. I
replaced it with
an electrolytic cap with no problems.

Reg, you're not stupid so why insist on being ignorant???
Have you NO knowledge of history? Even that of this century?

How many despots did dear old England have to endure for centuries before the populace rose up and demanded some resemblence of humane treatment? How long did we "North Americans" try to ignore the Nazi threat, stay out of it and let your "nature" take it's course before we came to realize that the threat was not just to those on the other side of the pond? How many repeats -of history- does it take to drum some sort of knowledge into any human? Fortunately not an infinite number for some of us. Not so sure about you.

We have learned that the undesirable traits in human nature tend to try to dominate the desirable-so we must remain eternally vigilant so that the Hitlers, Stalins, Pol Pots et al are nipped in the bud, and not at the cost of millions of innocent lives.

Yes--Milosevich, too, is an "educated man". So what does that help?
Did he "rob" anyone???

73, Dick

If I chop the 60Hz AC input into an HV power transformer (forget the filaments taps for a minute.) what problems does anyone foresee with spikes, rfi and controlling the HV ouput of the transformer.

I am trying to make a supply which ramps the DC output from 100 to 350V, where the nominal dc ouput of the supply would have been 350V - and to do this without a regulator which generates a lot of heat.

If I wanted to wind the transformer I could probably do this in PWM with one of the Motorola chips. Being lazy I prefer a less elegant solution.

Not being a student of economics, I cannot offer a logical argument, but to me it would appear to me that the wealth that Bill Gates has accumulated and redistributed was not actually created.

His money came from selling products that *he* was responsible for, as opposed to other products, such as food, clothing, cars, televisions etc.

A person has an amount of 'disposable' income and many see fit to spend it in a way that benefits Mr Gates.

You could look in yahoo.com for the K8+ Keyer, it's from K1EL, extremely simple, sourcecode is released, works with a PIC 12C509, costs abt. $ 3.

> Roy Lewallen, W7EL
> -- cursed with an engineer's way of thinking.

Well, you're cursed with some kind of thinking, that's for sure. But
I think you didn't throw in all the other considerations.

As an example, I managed apartments and the guy who owned them would
buy those cheap Hungarian light bulbs for four for 99 cents or some
cut rate deal. So I get up on a ladder to change the light bulbs on
the outside of the apartments and it costs him a buck or so for ten
minutes, at the then prevailing rate of $7 an hour back then in the
late 70's. I grabbed a box of four bulbs and tried them in the
socket, and the first three fizzled after a few seconds of light, and
I think the fourth stayed on for awhile.

In any case, it cost him more for me to have to change the bulbs more often because they were el cheapo bulbs, even tho they cost less. Moral of this story is that he should have taken the same path that his employer did. He worked for McDonnel-Douglas, and the maintenance crews would go around to each building and pull out ALL the fluorescent lamps and replace them on a periodic basis, saving the time of having to come back and replace the bad ones often. They figured that the cost of the added lamps was a lot less than the labor to put them in, rightly so.
But hey, I wasn't complaining, starving student that I was, I needed the money.

So back to the batteries, I guess one should count the time it takes to buy the batteries, the gas to go to the store, the cost of storing them in the fridge AKA cooling costs, etc., etc., etc. There's bound to be more, that are not part of the crank-up radio costs. Besides, we could all afford to expend a few more calories, couldn't we.

BTW, I think at least double that 10 mA at 6V would be more realistic. So maybe 75 hours.

to
> me it would appear to me that the wealth that Bill Gates has accumulated
and
> redistributed was not actually created.

Ok, the stated premise is that the wealth was redistributed. Bill Gates now has assets of somewhere around $100,000,000,000 - who is now doing without that hundred billion?

> His money came from selling products that *he* was responsible for, as
opposed
> to other products, such as food, clothing, cars, televisions etc.

Actually, most of his money didn't come =from= anywhere. In fact, most of his wealth isn't money at all, but calculated by his stock holdings.

Consider Marc Andersson (or whichever variant of the name he uses) of Netscape fame:
He goes to bed the night before Netscape's IPO and really doesn't have a lot of money. The next day, trading opens, and his holdings are suddenly worth tens of millions - nobody gave him any money, but his wealth was suddenly created.

The other thing to consider is that every minute of every day our various mints and the treasury are creating more money - wealth created. (Which creates inflation, btw...)

But we digress. This topic should be moved to one of the economic discussion groups.

If you use a NMO mount with a 1/4 wave wire antenna cut for 145 Mhz. it will work nice at 3x145Mhz = 435 Mhz. The pattern will have a up lobe as well as one on horizon, but the loss will be small.

That is correct. The Japanese transistors - 2SA, 2SB, 2SC and 2SD -
generally are labelled with the "2S" omitted. Hence, you have above
2SA1012, 2SD880, 2SD549, etc.

Also, the Japanese 2SA and 2SB are all PNP and the 2SC and 2SD are NPN
devices.

Hello again all,

Yes, there has been loads of activity on the homepage. I have recently added an FM narrow-band RX that is about the size of a cigarette packet and has space to add prototype circuits, such as R/C of models, AF amplifier, data decoders, etc. the set is ideal for HF FSK and will work on any frequency up to 100MHz or more. Naturally there is a PCB layout and component overlay to download and the project is well photographed.

Following many requests I have also added info on building an antenna tuner with a few hints on other methods. Forgive me for not taking this subject so seriously, but all the info is accurate, complete with photograph. Do not be put off by chapter titles such as "ADDING KNOBS" but I feel an ATU/ASTU/ASCTU is a waste of effort on 90% of cases.

The technical message board has seen loads of activity about all aspects, including whether the Reflux still should have the coolant fed to the reflux condenser or the final stage alcohol condenser first. What are your views? I think it is a bit like asking whether the propellor should be mounted at the back of the aeroplane pushing or at the front pulling. Whichever way the still works fine and produced some high-grade alcohol.

The electronic calculator was extended a few weeks ago, thanks to the HTML advice received from another newsgroup. Now that i can handle square-roots I have added frequency and coil-winding calculations to the tables.

I have also received loads of E-mail asking how I draw my circuits and PCB foil patterns. there is a page there with examples that explain everything, right down to the keyboard keys to push. Do not expect any high-tech answers because it is very basic and simple. No software, No code, No preaching about products. you have all the software you need in you basic computer.

Well, there is the latest news, sorry there is not too much of it at the moment. Best regards from Harry

Yes, loads of them, I live in Sweden where one just pays and pays (and pays and pays ..) when companies charge what they like. It costs $10 just to change an International Money Order in a bank over here! Ok, component suppliers "on-Line":

The only one I really trust on-line in the USA is AES at http://www.tubesandmore.com They have loads of tubes and stuff for antique radio. They are also a goldmine for the constructor.

One basic problem with other suppliers is that many others are cheap but for the personal touch then you have to pay $15 minimum postage (and I also get hit with customs too!). Bardwells in the UK at http://www.bardwells.co.uk/ also have a cat on-line and they accept VISA cards. The components are ridiculously cheap and they will usually write "GIFT" and "HAPPY BIRTHDAY" on the package (for customs).

Then there is Maplin Electronics also in the UK at http.//www.maplin.co.uk and they have loads of stuff on line, and their postal charges start at $7.5 Not nearly as cheap a Bardwells, but they have a wider variety.

If I come accross any more decent suppliers myself I will post them to http://hem2.passagen.se/sm0vpo/info/supply.htm along with those listed above.

I am thinking about a homebrew GPS based frequency standard derived from the W5OJM design.

If a replace the DAC which drives the tuning input of the OCXO by a DDS, what kind of performances can be achieved ?

The idea is to use a free running OCXO. Its output is connected to a 32 bits DDS chip. The PLL algorithm drives the phase step register.

With a 32 bits DDS I have 2.5e-10 resolution. I assume I can achieve 1/10 performances with the PLL locked to the GPS signal (2.5e-9). But it is only assumption ! Anyone having some theorical background to give the right achievable performance ? May be some inconveniences for this design ?

Certainly, wealth is created daily... If it were not then the increased billions of population alive today who were not alive four thousand years ago would never see a single dollar in their entire lifetimes, nor would they have even a scrap of cloth to cover their nakedness... Yet, we have the most wealth in circulation today that we have had in 4000 years of recorded history...

Guess it depends on how ya look at it! THERE is NO real backing for the earthly things we so covet including "money". The ONLY backing for the paper money we circulate today is our belief that it WILL buy something tommorrow! Period.... How long in our present state of affairs will it last? Sparks my two cents worth...

Some fast analog buffers driving some 4066 switches driving another fast analog buffer would do the trick. You could use a 555 into a long divider (4060?) to do the sequencing. The monitor will roll at each switch, but that shouldn't be too much of a problem.

It gets MUCH harder to show them all simultaneously on a split screen. For one thing, the synchronizing pulses for all sources must happen at the same time; this requires either "genlocking" the pulse generators in the sources, or digitizing and storing the incoming video so it can be read back out in time with a reference source.

Dick's right, and it has nothing to do with inflation, but it requires some background in economics to understand why this is so. Money is fungible, and elastic, each time it changes hands it has an economic effect. I can't give you an economics course in a post, but let me try to give an example which might make things a bit clearer. Lets suppose the government spends 1 million dollars a year in each of two different communities. In one community, it spends the money by giving 500,000 people each $2. In another community it buys 1,000 high tech widgets that cost $1,000 each from a local company. Which will have a bigger impact on the local economy?

You seem to be saying that the two expenditures will have the same effect, but they won't. In the first case, people will buy a hamburger, a pack of smokes, or a bottle of Ripple with their $2 windfall, and that's basically the end of the story. The money is dilute, and goes for basic items with little or no multiplier.

But in the second community the company hires engineers and production staff to make the widgets for the government. Each of those people make good money and buy a house, a car, furniture, a new TV, etc. The contractors building the houses, the car dealers, the furniture makers, etc all hire people to produce and sell these items to them. Those people in turn are able to buy relatively big ticket items too. So the dollars turn over in the economy several times over the course of a year instead of once or twice because the wealth is distributed in larger chunks and can have secondary and tertiary effects in the local economy as it cascades through it during the year.

In high tech high wage areas, the multiplier in the local economy is often seven times or more. You get a "boom town" built up around the high tech industry and the businesses which cater to the workers of that high tech industry. In low tech

low wage areas (ie mill towns, farming areas, etc), or with poverty program giveaways, the multiplier is low, generally less than two, so those areas remain depressed compared to the other town, though the same amount of money has been injected into their economies by the government. The difference is that in the former case the money is in large enough lumps to generate job producing secondary and tertiary economic activity while in the latter case it is so dilute that it has little secondary and tertiary impact (or quickly becomes so concentrated in a few hands, ie the mill owner, the company store, etc, that it can't be spent again fast enough in the local economy to have a major impact).

Economists say that money has "velocity", meaning that it moves through the economy at a certain rate. Money in larger chunks retains its velocity better than money that's finely dispersed. It can be said to have an "inertia" proportional to the size of the chunks. This lets it have a bigger impact at each level as it cascades through the economy. There is a size that is so large that it can't easily make it through the porosity of the local economy, however. In other words, a rich man can only watch so many TVs, drive so many cars, or get so many haircuts. So the multiplier again falls when the chunk size passes a certain limit.

There's a size range where the money will retain maximum velocity in the local economy, and have the largest multiplier effect. This can be calculated fairly closely by econometric models. The peak is roughly when the primary wage generated by the injected capital is in the range of $50,000 to $150,000 a year. That's large enough to spur big ticket purchasing activity, but small enough that the money can easily be spent locally. It also happens to be in the range paid by makers of military hardware, which means that the government's buying of big ticket military goods is a spur to the economy.

It then doesn't matter if the hardware gets parked in a desert, or is sent to the scrapyard, or is shot to the Moon. It has already had its economic impact. What we don't want it to do is to have a civilian use. That puts the government in the market in competition with its own people, and acts as a drag on the economy.

(For example, the government could just buy John Deere tractors, that would spur the economy where they are made just the same as if they were buying M1A tanks, but buying tractors would bid up the market price of tractors for farmers and construction companies, ie supply and demand, so it would have a net negative effect on the overall economy. For maximum stimulus effect without undesired side effects, we want the government to buy things that have no civilian use so that they aren't competitors in the marketplace with civilians for those goods.)

That's also why the government destroyed its old ICBM launchers instead of selling them as cut rate satellite launchers. If they had done that, they'd have depressed the market for new launchers and hurt the economies of the areas where they are produced.

Jake, thanks very much for your insightful and kind input. Too bad
you don't know what you're talking about.

#1- What's wrong with promoting an online business?
#2- I have no connection whatever with Dalbani except as a satisfied
customer.
#3- Dalbani is very slow in getting their product line onto their web
page. However, they have a good catalog for the asking, and often
have parts in stock, especially semiconductors, that others don't
have and at lower prices.
#4- I was steered to Dalbani by a post in sci.electronics.repair,
which I didn't think was "shamefully shilling" since the post was
very useful to me.
#5- When I'm shamelessly shilling for my own business I'll include the
info in the post. There's nothing shameful about advertising.
Too bad I'm wasting time trying to help a fellow homebrewer out
when it results in responses like yours. Time that I **could**
be spending at MY business.
#6- Instead of wasting YOUR time flaming me, why not try dalbani instead?
In the past I've called their toll free number to see if they
had odd items in stock like the ones listed originally, but
since I DO have a business of my own to take care of, I just
try to pass on the info: (ah, er, no connection to myself, wasted breath, I know)

Contact Information:

Telephone 1-800-dalbani
FAX 1-305-594-6588
Postal address 4225 NW 72nd Ave. Miami, Florida 33166

>is only assumption ! Anyone having some theorical background to give the

When I helped develope HP "smart clock" GPS frequency references a few
years ago, there was a running debate as to whether it is better to
use a DAC with a VCXO or a fixed OCXO followed by a offset frequency
synthesizer. We determined that in the HP 10811 oscillator, replacing
the varactor with a fixed capacitor does not improve the performance of
the oscillator (because other error sources dominate). So that reason
for not using a DAC is eliminated. We also determined that with the
modern DAC's that are available, the DAC error does not need to be
significant in terms of other oscillator instabilities. That doesn't
necessarily mean W5OJM's DAC is good enough, but the DAC HP used was
quite adequate.

OTOH, trying to add a DDS after the oscillator is a can of worms. We
had one customer who wanted to do that and we had to rule it out because
of DDS spurs. If you are *not* going to multiply the reference to
UHF/microwave frequencies, maybe you can tolerate the spurs. But
why bother?

On my web site <<http://www.karlquist.com>> there are a couple of papers
I wrote on high resolution offset sythesizers that would be candidates
to follow an OCXO. However, they are fairly complex so I don't think
you would want to go to the trouble to eliminate a DAC. In particular,
see my 1995 Frequency Control Symposium paper.

HP makes a much more stable oscillator called the E1938A (also documented
on my web site) which requires a much better DAC. Now that DAC was
truly difficult to design and in that case, there would be more justification
to go to an offset synthesizer. However, we put the voltage reference for
the DAC inside the crystal oven that we had anyway, and used a really
good DAC and got away with it. (But don't try this at home kids!)

So in conclusion re: DDS; nice thought but you probably don't want to do that.

Does anybody know of designs for (or commercially available) transverter using a 2m multimode rig (eg FT290) as an IF to cover the HF bands?

Or is there a good reason why such a setup would not work well?

My knowledge is a little rusty- I've been out of amateur radio for quite a while.

Thanks,

John

Hello , I have a VX-5 forsales. NEW CONDITION It's about 3 months old
a 9Dxxxxxx series ,and I have never had a problem with it.
It didn't do any hardware mods, I just use the Sofeware EVE to mods it. I'm
not use 6 meters at all since there has no 6M repeater.
and the main reason I selling it is I need the money for my school . It's
comes with radio,antenna, box ,manual , case(CSC-73), Rapid desk
charger(CD-15), Mic adapter(CT-44)and
the RS clip on belt clip. I don't want to give it up but
I need to pay by school for next year. I'm asking $349 + shipping.Thanks
you!! Victor iden1000@hotmail.com

as far as I know, wealth is not created or
destroyed, just redistributed. This doesn't feel right, so please
explain.
>
> Question: from whom was Bill Gates' wealth redistributed?
>
> Wealth is most certainly created... ever hear the term "economic growth"?
>

Wealth is most certainly created, and is the driver of economic
growth. One learns this in Economics 101. But wealth is generally not
created, only redistributed, by the Government. What you learn in
Economics 101 is that the accumulation of wealth is not a "zero sum
game", as was (is?) believed by folks of the Socialist and Communist
persuasion. Someone getting rich is not necessarily rich because he has
taken it from someone else. He may have created the wealth, as has
Billy Gates.
Gates has already created as much or more wealth than many of the
previous tycoons, such as Vanderbilt, Carnegie, Rockefeller, etc. And,
this wealth is far more widely dispributed: Microsoft has created over
1000 millionaires. None of this came from taxes, or as redistributions
from Government, but instead it was created in spite of Government
redistribution policies.
It amazes me that this elementary economic concept is not understood
by even many 'educated' people today.

Primus OM,

Try the Embedded Research TICK keyer chips, in DIP and SMT packages.
I use one for CW mobile Chip and board are 1 inch square, run off a 3V
disc battery, and can be glued under the base of a Bencher paddle. It
is programmable from the key also, making it a FB solution for CW mobile
or any other use.

Fellow hams and experimenters!

I have recently tried to connect my computer to my 570-S for PSK-31 and while I can receive signals, I am unable to transmit audio through the 570 by using the rear Acc. 2 jack (pins 11-12). I have good signals at the connector and I have used the same wiring from my computer to send PSK over my old TS.830.

Before I tear my 570 apart, I thought that I would inquire if others had success or failure with their 570's and PSK 31 by using the rear Acc Jack of the 570. I have not tried going directly to the microphone input since I do not have the parts necessary for the attenuator and my closest Radio Shack is 70 miles away.

Any help would be appreciated.

Tnx es 73

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

CCS C Pic Programs?

I am having great fun playing with the Basic Stamp 2
as well as some PICs.

My Basic Stamp 2 CW IDer is completed:

http://www.qex.net/k7on/stamp/cwider.htm

My next step is to use the CW ID as part of my 900MHz
ATV "beacon" system. As it currently stands, I have the
BS2 interfaced with a BOB-II video overlay module. I will
next add the DTMF decoder and control receiver inputs.

Also, I have built up my PIC-E from TAPR and have been
playing with that. I acquired the CCS C compiler for PIC
and am playing around, but I'd like to find some good sample
programs written for 16F84 with CCS C (preferably amateur
related)? Sources? (pun intended)

Thanks in advance, Brian

This is the part that troubles me. I've always suspected that my future retirement hinges on everyone buying in (yuck yuck) on this shared fantasy of wealth. So, is it real, or just a figment?

Certainly there's real value in Microsoft's intellectual property, and in the ore mined from the hills. Where and how are these accounted for in whatever counts these things? Is more currency printed to reflect the value of the software I write, or the book I authored? Or does that wait until the mining company uses it in connection with digging up some more dirt?

Michael.

You need to also connect the ACC2 PTT and its ground; VOX doesn't work on ACC2. I think it's pins 9 and 6, but you should check the manual to make sure. I use a simple diode and a 12v reed relay on the serial port's DTR line to isolate the PC's ground from the radio.

Michael.

I have been thinking of getting one of the TiCK kits for use with my grid-block keyed Drake B-line. How do you mod a SS keyer for use on a rig with a HV key-line? I have heard one way is to use a reed relay, but how is it inserted in the keyer circuit? Ideally would like it wired to switch from tube to SS usage. Also, I am not sure if my Drake and other tube rigs were negative or positive key closure?

I am in need of a Motorola MC12179 PLL IC.
These have a fixed divide by 256 and work up to
2.8GHZ. Does anyone have one or two that could sell me?

Molorola will be delivering this part in a few weeks and I don't want to
wait on a project I am working on.

I have the chance to pick up a nice 7 foot dish. Since my
10 footer is working fine I don't really need it but I thought
there may be some other way to use it.
What other uses for a dish are there? Does anyone do
geosynchronous weather satellite reception? Amateur
radio astronomy? What about full azamuth and elevation mounts?
Any web sites?

>What are these things? I have read several articles on radio projects which
>use Ge transistors, and they are often described as 'red spot' or 'white
>spot' . What does this mean?

On the early GE transistors, such as the 2N2926 series, the color dot indicated the Beta range. OEM's bought production lots of these devices, and were guaranteed a certain number in the various Beta categories. Some designs made use of this. The lower Beta devices (brown and red) were used as local oscillators, drivers or switches, while the higher Beta units (green and blue) were used for high gain audio stages.

Will OM,

1). Measure your older rigs' key-up voltage. That will tell you its polarity and level.

2). You can key either polarity of any voltage with the appropriate output circuit arrangement. The simplest way is just key a reed relay with the existing keyer circuit's output. Connect the relay winding in series with sufficient voltage of correct polarity to operate the relay, in series with the output switching device in the keyer. If this is a problem for you to understand, you need to review basic series-connected circuits, or have someone who knows elementary DC circuits help you with it. This level of circuit knowledge is covered in the written exam for General class or higher ham tickets..

3) You can have two output connectors on your keyer, one for the HV keyed rigs (cathode keying, positive high voltage on the key), and for newer negative or positive low-voltage keyed rigs.

See any ARRL handbook for examples of keying arrangements.

Jim OM,
You can order small parts mail order via phone or fax. No need to
drive 70 miles to a poor source (RS). Try Digi-Key, Mouser, Dan's
Small Parts, etc. Web search will give you details on them.
You need a junk box with at least a coffee can full of resistors and
small caps, just for general purposes around the shack. Dan's Small
Parts is a good source for grab bags of parts.

I see you are in the UK so here is the answer.

Newmarket Transistors, a very early UK semi manufacturer had a range of 4 or 5 different types of transistor to cover RF, AF output , AF preamp etc. This was in the VERY early days of transistors, before Newmarket Semi used alpha / numeric part number designations. Instead they used coloured spots to denote type (these are not the spots used by some manufacturers to indicate the Collector on some later devices which used alpha / numeric number designations)

So a Red and Yellow spot was an RF transistor, a Yellow and Green spot was an AF Output. There where only a few other spot combinations, their range of transistors was very small. I probably have a few tucked away somewhere.

Looking for a Manual... user and/or service or whatever...

Hey all, Need a hand identifying/using a Motorola signal generator. Looks to be about 60's vintage.. I NEED A MANUAL!!! please....
plate on top says:

Manufactured for Motorola, Inc

MEASUREMENTS
A McGraw-Edison Division
Boonton New Jersey
Model: T-1034-C serial: 5480

Goes about 24-900 MHz ext./cw/1000Hz tone/incr.
and has seperate I.F. generator, inputs... has output deviation meter and adjustment.

Anyone got any ideas? Does Moto still have literature on this boatanchor?
It works fine and seems to be the rx tuning half of today's service monitors. Breaks my maxtrac squelch at .2mV using 2:1 pad... ?
thanks,
Randy

922. Re: Bi-band mobile antenna ?

Newsgroup: rec.radio.amateur.homebrew

Source record: 68867

If you use a NMO mount with a 1/4 wave wire antenna cut for 145 Mhz. it will work nice at 3x145Mhz = 435 Mhz. The pattern will have a up lobe as well as one on horizon, but the loss will be small.

That may give decent SWR at 70cm and thus won't make your rig unhappy. But it's not a great antenna for terrestrial use. That's what i use on my van most of the time. It's suboptimal but it works. Here's my attempt to simulate a similar antenna, since i was interested in the space sub-band:

http://www.qsl.net/kd6pag/nec/2mModGndP.html

So, at 70cm, most of the signal goes skyward. But that's just what i want to work AO-27! I ran that way for about a half year, just a 2 meter spike, no diplexer and no pre-amp. (And AO-27 is not easy to hear.) By the way, a gain omni antenna intended for terrestrial use make a very poor antenna for satellite operates except for rather low elevation passes.

So, i think you'll be much happier with a commercial antenna and just put up with a mild SWR mismatch in the 70cm band. But if you enjoy homebrew antennas, keep lookin'. Or take the commercial version, and replace the middle rod with something just a little longer to tune it (albeit that may tweak the pattern in the vertical plane off a bit). Good luck!

To be fair, you'd want to only count the extra time buying
batteries. I'm thinking most people with a technical
background (like everyone on this thread, I'm sure), is
buying their AA cells along with the rest of their groceries
& storing them for later use, either shelf or fridge.

I suspect the questions are: Will you ever use the radio
enough to recover the extra cost of the wind up radio vs.
batteries for a less expensive radio? If so, will the
mechanicals of the wind-up radio actually last long enough
for this cost recovery to happen?

The wind up radio is a cool gizmo, I'll grant you. For an
emergency radio it has some applications, too. But I'd much
rather have some kind of human powered generator that would
be powerfull enough to effectively run my 2 meter rig...
(or charge a battery to do same.)

My final thought on the wind up? I'd guestimate that I
could run a milliamp powered AM/FM radio a couple of hours a
day for about a year on the battery in my truck outside.
The value of that concept to me is that I'd spend my budget
for backup communications in areas that have, to me, a
better payoff.

Now where do you find those wind up generators they used to
power the tube sets in all the old WW2 jungle movies??

>BTW, I think at least double that 10 mA at 6V would be more
>realistic. So maybe 75 hours.

Just random thoughts

Well, I was thinking decadence in terms of saving a buck
and a half on batteries - but I've read SF stories about
post-holocaust where everybody had to take turns pedaling
the air recycler in the shelter and stuff.

Inventions you haven't made any money on? How about:

A steam car that uses an instant-heat propane boiler and
a blower (as in supercharger, like on racing engines, and
Deisel big rigs) run as a positive expansion turbine?

A recumbent bicycle a la
http://www.entheosengineering.com/images/Recumbent-bike-draft-1.gif
where the pedals pivot instead of circling a crankshaft.

A turbine-powered (a la Kirby Turbo-brush) paint scraper thing
for house-painting, where the turbine vibrates a beater-bar
type thing, and it just sticks on the end of a shop-vac hose.

I got a million of 'em, including about a half-dozen that I've
done for companies that have since gone belly-up. Wonder if
I'm some kind of jinx?

:)
Cheers!
Rich

I recently bought a morse and RTTY decoder which was a constructional project in 1987 ham radio today magazine.The decoder uses a PLL and a couple of Z80 chips, with a centronics type output connector, and the article called it a 'microchip morse decoder'. I am looking for the original article so that I know where I am with it. If anyone has the original article, from around june 1987, please let me know, likewise if anyone else has built the decoder.

thanks.

Howdy,

I'm looking at purchasing the Fireball 40 transitter but, before I do I'd like to find a reciever along the same construction standards and definitely along the same price. The Fireball 40 is only $10 shipped as a kit. Does anyone know of a kit like this for a reciever?? I've been looking everywhere.. Any help would be appreciated.

Currency is just one counter used as an exchange medium for trading wealth.
The "money supply" at any given time is the sum of the current deposits in banks
(just numbers in a computer), available lines of credit (again just numbers in a
computer), other liquid assets (ie readily convertible T-bills etc), and currency.
The latter is the smallest, representing less than 10% of the current money
supply at any given moment.

Money, at least US paper currency, is just a form of promissory note. Its
real value is less than 1 cent per bill. But as a counter, it serves in place
of barter to let us trade among ourselves items of value, as do checks,
credit cards, etc. The items of value are the goods and services which
we wish to obtain or have performed, or which we produce or are willing
to perform.

Is wealth real? Well yes, it is as real as anything can be in human terms. It is as real as love, hate, want, envy, and desire. But every price is flexible. The free market sets what we agree to be the value of a good or service at any given moment. Nothing has an absolute value for all time. Goods and services don't, and the counter we use in their stead (money) doesn't either.

Fashions in what is desirable change, circumstances change, the value we assign to things goes up and down. When I'm hungry, a hamburger has more value than when I'm sated. I may value an hour of my time more or less than you do today. Etc. The market averages these things out, but even the average value doesn't stay the same over time. 40 years ago, hoola hoops, coonskin caps, and tailfins had a lot of value. Today they are a drag on the market.

Some things retain a constant value better than others, of course. But even gold and silver swing wildly in value. For many years, I had Coffman's rule of meat. That said that a US made car cost the same, pound for pound, as hamburger. It did from the 1920s through the 1960s, but then government interference in the market drove the price of autos up (CAFE, emissions standards, 5 MPH bumpers, airbags, ie things the average consumer wouldn't choose in a free market), so now autos cost the same as filet mignon, pound for pound. Does that represent a real increase in wealth? I don't think so. Only the free unfettered and uncoerced market can determine true wealth.

Greetings all,
I have a few Vacuum variables up for sale.
I have pictures of each if interested parties request them.

#1 is a Jennings Radio usls 465
465pf 5KV @ Max Cap 10KV @ Min Cap

It is complete, asking $120 obo

#2 Jennings Radio ucsl 250
250 pf
5,000 Volts.

Asking $90 obo

#3 Jennings 3,000 Volts ucsl-1500-3n103

It has a non standard head, but complete.
$160 obo

#4 Jennings Radio ucs 300
10,000 Volts

It has a scale and meter on the head.
$200 obo

#5 Jennings Radio Type UXC -500
500 pF maximum capacitance.

$160 obo

Pictures are available upon request.
Money order is preferred, but will take personal check,
however I will wait for it to clear before I ship.
Will ship UPS or USPS whatever is preferred.

Jay, N1RWY

Please:

Is there some kind soul out there that owns a Kenwood IF10B interface module and is willing to share some information ?

I have been unable to locate an IF10B module (the part of the computer interface that fits inside the TS940S) and have come to the conclusion, after many hours of research, that finding one will be next to impossible.

At this point the best option appears to be the construction of a "replacement" module for the IF10B. To facilitate construction of a replacement module the following information is necessary:

Schematic of the IF10B.
Source Code for the Eprom.
Pictures or direct scans of the Kenwood printed circuit board.

I plan to use cad and photoresist to duplicate the "daughter" board giving me the ability to help others once a successful replacement has been verified.

Any information that you can supply would be greatly appreciated.

Thank you and 73
Larry KA9GCI

Source record: 68789

If you don't have the schematic why not just add on a switching "buck" converter - you won't give up a lot of energy as heat that way. The equations for the coil etc.are given on a couple manufacturer web pages and the chip is only a dollar or so.

I was thinking of building a switching "boost" converter to generate HV from a computer switching supply for a tube tester. Oftentimes these computer ps are available for only a few dollars at TechAmerica or JDR.

You probably want to put a pair of chokes on the a.c. input and some ferrite beads etc.

Hey, in our gym we've got the exercise bicycles that, believe it or not, have a hood on the front, underneath which is a small alternator from a car. The thing has a variable load and a display that also runs off it.

Humans can do maybe a hundred watts but that's pushing it. For longer periods it's somewhat less. Yeah, I guess that's decadence.

Hey, YEAH! Maybe instead put a generator on the remote control, so it has to have a certain expenditure of calories to make it work! Decadence with a twist!

Speaking of.. Why hasn't anyone come out with a system that works just like a little kiddie car, the ones with the pedals connected to rods that connect to a crankshaft? Something like that to eliminate the chain, make it simpler. I guess maybe because there's no easy way to change gears?? I was thinking on maybe somehow changing the crank radius. Or instead of a crank, use a ratchet mechanism.

There may be an adjustment inside that will permit you to adjust up to
13.8. If you want to charge batteries with the PS, be careful. You'll
boil them away unless you monitor their condition.

If you want to run your TX at 13.8V, good move! A small voltage
difference makes a large difference in power out.

I heard that the PWR Supply from a microwave can be modified to
supply a PA tube with 2-2,5 Kv.
Sounds interesting to me.
Anyone with experience reg. rectifier, filter capacitor etc.

RFI may be a problem depending on how well the PS is made.
A secondary shielded enclosure with bypassing and ferrite
cores *could* be needed to clean up the hash. ...A try it
and see.

Almost all regulated supplies will have an internal
reference voltage and a group of resistors which "sample"
the output for comparison to the reference. Within
limitations established by other circuit paramaters (YMMV)
the voltage can typically be raised by changing the
reference voltage (often generated within a regulator IC) or
the resistive feedback network.

Typically raising the reference voltage will raise the
output correspondingly. It is possible that some references
may be connected to an inverting amp. In that case lowering
the ref would raise the output.

Adding the right value potentiometer (connected as variable
resistor- 2 terminals) between ground and the (output of)
feedback circuit. That is NOT the PS output, but after the
resistive divider / feedback network. Exact value will
depend on current network values. Keep in mind that you
want to drop the REF voltage from the output about 1.8 volts
over the current value. That way the PS output will go up
bu 1.8 volts to compensate. ...There is often already a
potentiometer in the feedback circuit to vernier the output
of the stock PS, but may not have sufficient range.

Most PC supplies are switchers, running from full wave
rectified line (170vac), so "headroom" voltage for
regulation at the higher output level should not be too much
of a problem.

Popular Electronics did an article or two years ago about someone utilizing a bicycle/generator system in configuration with a television. If the kids wanted to watch a program, they had to peddle away during the program to provide enough current for the set. I have seen similar units in use for Field Day, and they do work.

>Anyone knows if RIAA-correction was used for old 78 turns per minute >records?

Hello,

No, they don't.

That question brings me back to my early childhood...

Until the mid-50s or later, there were actually several different equalization curves in use by different record companies. Records from different companies and different eras had very different curves.

In the '50s there were several curves in use in the USA alone. The industry wanted a single standard, and the RIAA (Recording Industry Association of America) equalization curve was the winner. By 1960 or so all records in the US were produced using this curve.

The reason the question brings me back is that from as far back as I can remember, my father was a "hi-fi" enthusiast. (Still is!). The first "serious" equipment he had that I remember was the Fisher mono preamp and 50 watt power amplifier. The preamp had all the usual controls, plus two levers (one for the low end, one for the high end) to set the equalization on various records. Of course a curious small boy had endless fun making the records sound funny by manipulating the levers.

Woody hit the nail on the head. I will add one additional fact to his comments. PC power supplies take there feedback off of the 5 volt supply. As such find the feedback resistor, lift one end add additional resistance to that resistor and attach it to the + 12v line. I guess the only other comment I would have is that most of the 12v power supplies that I have seen do not deliver that much current, however the price of the PC supplies is usually very inexpensive and you can do all kinds of things with them.
Gud Luc and let us know how you do,
Paul.

Of course this is a joke!!
Power mics on 2 meter sets would more than likely distortthe audio so badly you couldn't understand it, and would also more than likely make the carrier deviate a lot more than the legal 5 khz, resulting in splattering or the very least severe clipping.

Just checking to see if anyone is awake out there!!

Actually, this sort of thing used to be fairly common, back when the surplus market was loaded with cheap aircraft generators. With a gas engine attached, they could also make useful welders. Now, it'd be a whole 'nother thing. Silicon is cheap, structural steel is not too expensive, but lots of copper and magnetic iron is another story.

And knowing in advance this doesn't belong in this newsgroup, you posted
it here anyway instead of in rec.radio.swap where it belongs? Or in
rec.radio.amateur.antennas, where it would still be spam but at least be
on topic?

So, basically, you're going out of your way to be nasty. Is that it?

But the KEY POINT (according to FEMA's consultant) is that the re-radiated
energy builds up IN PHASE because the point at which new radiation is
being generated is advancing just as fast as the newly-generated wavefront
is propagating, i.e. at the speed of light. This is what gives the EMP
its very sharp wavefront and wide bandwidth, which in turn is what makes
bypassing and shielding tricky.

Actually there is no 5kHz legal limit on FM deviation on 2 meters in the amateur service.. if I'm not mistaken, one could legally run the full FM broadcast deviation of 75kHz, and occasionally did in the early modulated-oscillator days 40 years ago.

Now if you tried that today, you'd clobber much of the repeater band and probably get a pink ticket for failing to observe "good amateur practice"... (and probably "intentional QRM" unless you could show you were dumb enough to not understand the technical consequences...)

I polled the fitness newsgroups to see if they knew of any standard bicycle
stands for indoor use. I'd seen one with a 4" squirrel cage fan for
dissipating the power thus using the bicycle's gears to adjust the pedal
resistance. I figured we could yank the fan and drop in an alternator,
etc. One respondent to the poll pointed me to:
http://www.nashbar.com/catalog/bike/display_html/bikeindex.html
Maybe we can come up with a simple adaptation. I'm crossposting to some
amateur radio groups to see if anyone there has done this modification
already. Any good ideas out there?

989. Frequency Hopping Handhelds

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-07 00:00:00 UTC
From: henryt@perth.dialix.com.au
Message-ID: <931306507.537696@newton.dialix.com.au>
Source record: 68735

Hi,
I am interested in homebrew of some frequency hopping handhelds. My thoughts are to adapt current radios by adding an extra control board using a PIC chip. The units would have a control channel where the TX would make a tone prior to commencing a predetermined hop. The RX of the other unit would hear the tone and also start to hop. Once in a while the TX would provide another tone for re-sync. The PIC would control tone transmission and reception and channel changing.

Has anyone had experience with making something along similar lines??

The problems I can see arising are:
-PLL will not settle fast enough
-Because of the above hopping speed may be VERY slow.

I have read the ARRL Spread Spectrum sourcebook. The units I am interested in building sound very similar to units made my an AMRAD member (1981 :-)) Chuck Phillip N4EZV, I can't find him on the net tho....I will try to find a US callbook.

Any assistance with helping me with this project would be greatly appreciated.

Best Regards From,
Henry,
VK6HJT

990. Homebuilt Rotatorv Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-07 00:00:00 UTC
From: Hansanter <shbcommm@indigo.ie>
Message-ID: <3782A1B8.15AAE539@indigo.ie>
Source record: 68736

Hi all,

I've built my own homebrew rotator and 'mechanically' it works quite well. The motor I used is a wiper motor from a large vehicle so it's 24 V. The whole thing is powered by a small transformer supplying 20 V at 3A (its well capable). In order to determine the antenna heading I have included a potentiometer in the rotator housing. In the control box I have a meter from an old multimeter calibrated in degrees (N,S,E,W etc) this is fed on one side by 20V from the transformer (the same line that feeds the direction switch) and on the other side by 10V from the center tab on the pot (via a 240k resistor and and a 20K cermet pot for calibrating). Can somebody tell me why the meter deflects fully left or right (depending on the direction the rotator turns) when I get the rotator to turn. When I release the 'TURN' switch the meter needle returns to indicate the direction. Obviously the motor is drawing current away from the meter but that's amps and I'm using the pot and meter to measure volts so it shouldn't drop - right ??

Thanks for your time.
Regards
Terry Gaff

991. G3RUH Modem

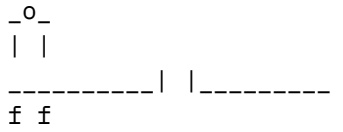
Message-ID: <378304FA.C0FE9991@rl.ac.uk>
Source record: 68738

I have a yagi, with an interesting type of feed. It looks like this (if you have a fixed width font)



The feed is indicated by points f f. the length of the matching section is about 50cm in total, designed to work at 28MHz. I am not sure of the name of this type of feed, the yagi is a 4 ele. My question regards what type of feeder this is for, open wire or after a balun, coax. It looks to me like the mid point of the matching section is connected to the boom. This is good as it makes all the parts grounded (essential).

I think it is probably low impeedance, say 75 or 50 ohms, designed for 75 ohm twin, or coax with a choke balun.

73 Mike

Something that occurs to me.. are you using the same earth return for
both motor power and metering.

If so the two or three amps of return current could be messing up the
meter current.

They should be separate wires really

HTH

Have a look at the G4XYW modem at
www.tvipug.freeserve.co.uk
which is RUH compatible (9k6 only) and also interfaces directly
to a TNC disconnect header with no additional components and
to a PA0HZP Opto-SCC card with no extra parts (both connector types
are on-board). Lots of other features such as CWID compatible,
hardware PTT watchdog, selection of TX waveforms, clock
generation and many other points.

Also available is a simple interface to allow the modem to be driven
directly from a PC serial port. So far DOS drivers for BPQ, xNOS
packet driver, Ethrax25 packet driver are ready.

Win95/win98 users are looked after by the SV2AGW packet engine
which now has a suitable driver.

Linux users will have a driver very soon!!

None of these drivers are required when using an SCC or TNC of
course - only if using the simple voltage converter.

Robin. G8ECJ

>I have seen this on other groups as well.I don't know what your
post was and I don't care.As long as someone stays basically in bounds
of the tone of the kind of postings that are on a newsgroup,they should
be able to post what they want.If a news group moves away from what the
founding members had in mind it is because the members that use the
group want it that way.Offering items for sale or trade is one reason
that people read NGs.Another is to look for services that other members
can provide to them.If this group was Tech and not Rec then the trading
of info might be the main thrust.Wheeling and dealing is a good way to
be able to upgrade,and also a good way to get the gear to take
advantage of the info being traded.Also it can be fun...ie:rec.

I just received my order here is Canada from an Arizona surplus dealer called Electronic Goldmine
http://www.goldmine-elec.com
I was very very happy with my purchase of Nicads as well as everything else.

They have their "High Capacity 12VDC 2.4Amp Ni-cad Battery" which is a plastic cased Novatel package, with a barrel-type power jack (their item number G8543). Yes, there are ten 2.4AH nicads in each pack. The price? Only $8 each or 10 for $50

Another interesting thing in the new catalog are BF989 Dual-gate Mosfets (my data book says they are for Input and Mixer stages in UHF tuners up to 900 MHz and gives specs at 800 MHz and 200MHz), their part number G5602. 69 cents each or ten for $6. They are in the SOT-143 surface mount package.

Since I have seen lots of homebrewers looking for Mosfets I figured you would want to know this source, and I think the Nicads are a bargain too.

1002. Re: RTTY decoder software

The serial port (COM) on most PC's runs with RS-232 standards. That
would mean using 12V rather than TTL at 5V.

Hi Peter

I had a similar problem a time ago and i took a little piece of
pcb-material, cut out the copper in the
middle (abt 3....5 mm wide) , soldered in two pins to fit the crystal
holder (in my case abt 1.5 mm dia)
and then solder in the crystal.

hope this will help
greetings

1006. Limiting full-charge output voltage of NiMh battery

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-07 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <7m0ikt$s8o@dfw-ixnews11.ix.netcom.com>
Source record: 68752

Trying out a 12-Cell NiMh battery to run a HF rig here. At full charge the battery ends up at about 17V. I am concerned about damage to the rig so I bypassed two cells and get full charge voltage of about 14V. During transmit, the battery (with two cells bypassed) drops to 10.5V or so at voice peaks (100W rig). That's expected (the voltage drop) but...

I'd like to find out is how to keep all 12 cells in the battery (better voltage during voice peaks, etc.) but not kill the rig when the charge is full and the rig is receiving.

I thought of using a power op-amp that would be in saturation whenever the supply voltage is below 14V, and set at output of 14V when the supply voltage is above 14V, but my current peak (20A) might make this not the best solution. A voltage regulator doesn't seem like a good idea because I'd like to continue using the 12 cell battery until it's voltage drops below 12V. A shunt (zener-style) regulator might be OK but it seems a waste to force the battery down to an acceptable voltage (14.5V or so?) before starting to use it, after charging.

Any other ideas?

73 Dave WB0GAZ dgf@netcom.com

1007. lower cost RF design software ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-07 00:00:00 UTC
From: emr01@ms19.hinet.net
Message-ID: <3783cba3.1528312@news.hinet.net>
Source record: 68753

Some of the often heard tools used in microwave circuit design
seems to be Harmonica from Ansoft (SuperCompact) or Tuch-Stone Libra
of EEsof series from HP; yet these software packages cost a lot
(for one that doest two or three small RF projects a year). Are there
any other lower cost microwave circuit design software available?

Best Regards,

Oliver

1011. Re: Limiting full-charge output voltage of NiMh battery

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-07 00:00:00 UTC
From: Bob Lewis <aa4pb@erols.com>
Message-ID: <7m1026$68g$1@autumn.news.rcn.net>
Source record: 68757

Your peak current may be exceeding the rating of the battery. NiMh voltage shouldn't drop that much under load (except over time as it discharges). Remember, batteries have two ratings, Ah capacity and peak current. A battery rated at 10Ah doesn't necessarily mean you can draw 10 Amps from it.

See if you can find an ARRL Radio Amateur's Handbook from about the end of WWII (when surplus 807s became plentiful) and about the mid-60's. They'll contain at least one 807 transmitter (almost surely with a 6AG7 oscillator). Or maybe you can find someone with the schematic for a Viking Adventurer or one of the popular rigs of the era which used 'em.

I recall having a large box full of 807s. Gave them away when I moved in '61. At one point I had a rig with a pair of 807s, modulated by a pair of 807s, all homebrew. Have fun!

Any ham magazine from the late '30s thru maybe the early '60s, ARRL and E&E Handbooks, QST CDROMs from the above dates,... Are you looking for a simple MOPA CW transmitter or something more elaborate?

The earliest xmtr article using an 807 in QST is in the September,1938 issue, pp 14-18 called "A Five Band Switching Exciter with 807 Output". I'm sure there are others in the handbooks as well. If you're interested in this article, I'll get a copy to you.

1026. WTD: notch filter or plans for notch filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-08 00:00:00 UTC
From: Michael Smith <mjs@nolnet.net>
Message-ID: <729h3.922$cO4.26203@news12.ispnews.com>
Source record: 68772
Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.swap,rec.radio.swap

I am looking for a cavity notch filter or plans for building a notch filter. I am not sure if a single notch filter would be tight enough. I am trying to notch out a undesired signal in band. I run a UHF repeater and I have a bad desense problem. I use a good bandpass notch duplexer and have added a DCI bandpass filter (the repeater is in a very high RF environment). I just found the source of my problems, in band. A near by amateur UHF packet station. I need to notch out this frequency that is only about 1.8 MHz away.

Any ideas???

Mike

hello.
i don't know a great deal about antennas (other than basic functionality).
i just got a 10m rig, and want to build an antenna for it. i live in an
apartment, so size is pretty crucial. any pointers to projects such as
this, or jumping off points are greatly appreciated.

thanks.

You might look into a buck-boost switching regulator. Check the Linear Tech web site for some semis and app notes that might help you get started.

Hi all,

Can anybody describe or send an image of a circuit that would be used in an antenna rotator/rotor unit to determine the heading of the antenna. I've built my own rotator and I'm curious as to the methods commercially used. I know a potentiometer is commonly used with an analogue meter.

From: corryAT@eburgDOT.com
Message-ID: <37856ea5.458597213@news.aa.net>
Source record: 68779

Hello to ya'll, anyone have a tried and true design for a 10m to 75m transverter? I have a multi mode handheld transciever that would work great for the IF for a 75m tranvertor. I figured a tranverter would be better/easier then building up a multi mode homebrew rig. Also, any comments on Dans 75m SSB Centenial (sp) qrp kit? Or perhaps some hints or kinks on a 75m transverter would help. I was getting ready to start building one up myself and figured I would ask first just in case any designs are out there already.

For shunt regulators, there are some ideas in the QEX article
downloadable from my web pages. For a series regulator, there's a
circuit on AG6K's site, http://www.vcnet.com/measures/

Either configuration may be workable, depending on the nature of your
load.

Most of TRW's RF power line was sold to Motorola Semiconductor Products. Since MSP has now been sold, too, you might want to get what you can find as fast as possible.

Have you talked to Richardson about the RF devices? They are pretty good about cross referencing. I see nothing in my 1979 TRW power BJT catalog named a

PT4370A.

1043. Re: 10m antenna design needed..

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-10 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <7m7efh$99c$1@plutonium.btinternet.com>
Source record: 68689

Jonathon,

It is always a good idea to begin with the most simple antenna even when you are blessed with a very large back yard.

The most simple antenna can be erected in a few minutes at negligible cost of materials. Get the feel of things with it. Then erect a slightly more complicated antenna and make some comparisons. Keep simple records of signal stength particularly of reception of local and distant radio beacons including date and time of day.

For the 10m band I suggest you begin with a simple dipole, fed in the centre with 50 or 75-ohm coaxial line straight into the rig. Dipole end-to-end length = 5 metres = 200 inches. Not critical within plus / minus 6 inches or so.

The dipole wire can be any sort, bare, enamelled or plastic insulated. Any old scrap stuff will do. Any gage from 26 to 14. The smaller wire diameters will be almost invisible outdoors.

End insulators :- 1.5 to 3 inches of any sort of plastic rod or bar or strip with holes drilled in each end.

The dipole, indoors or outdoors, need not be in a straight line. The ends can be bent downwards to form an inverted U ot V. Or one end bent sideways and the other end bent in another direction. It doesn't matter provided the end is not bent back through an angle greater than 90 degrees..

If you are really stuck for space then bend the ends round to form a square with the side opposite the feeder missing. But don't expect too much from a dipole of thin wire with its ends close together.

Most important characteristic of an antenna is its unobstructed height above ground in terms of wavelength. At one wavelength above ground, in your case 10 metres = 33 feet, you will be going places.

If you havn't enough space for any of the foregoing, come back to this newsgroup.

1046. 3SK122 info required

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-10 00:00:00 UTC
From: David Greenberg <daivi248@iol.co.il>
Message-ID: <7m7rutafm1@news2.inter.net.il>
Source record: 68692

Hi,

Can anybody help in finding the data sheet for the 3SK122 GaAsFET?
Is there any Web site that contain that info?

Thanks

==========
This type of wire is sometimes offered on this NG. It can also be
found at ham radio flea markets.
I bought 2 rolls of AWG 24 (hence slightly thinner than what you
need) at a flea market .
Cost : equiv. US$ 12.- for 250 metres (approx. 800 ft) . Wire is
7 strands ,silver plated
Nice for winding RF toroids.

==========
It might be useful for readers of this NG to know what the switch is
supposed to do ,ie number of decks and switch positions. Insulation
is probably ceramic .

1050. crystal load capacitance ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-10 00:00:00 UTC
From: Don <bjmcpher@usit.net>
Message-ID: <3787886A.3F411A42@usit.net>
Source record: 68696

I'm building a freq counter using a PIC 16F84 chip. These usually have a bout 20pf of capacitance on both the oscillators input and output. I want to use a trimmer (maybe a 10-40pf?) to substitute for one of these caps so I can vary the clock very slightly to get a fine calibration of the counter. Should I put the trimmer on the clock input or the clock output?

Don

1053. Re: crystal load capacitance ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-10 00:00:00 UTC
From: Rocci <rocci@worldnet.att.net>
Message-ID: <3787B23E.5C32042C@worldnet.att.net>
Source record: 68699

First of all, insure that the chip's oscillator circuit excites the
crystal's parallel resonant mode, otherwise you won't be able to pull it at
all. If the Input and Outut pins are connections to an inverter, you're OK.
If there is no inversion, the crystal will come up in the series mode.
Second, be sure that the crystal you're using has been marked for its
parallel resonant frequency. Many garden variety microporcessor clock
crystals from catalogs are marked for their series mode.
Assuming everything is set up as above, you should put your trimmer on the
input side of the oscillator inverter.

Inderdigital yes, and combline has moding depending upon geometry. Most engineers
follow bandpass filters with "clean up" filters that act as low pass filters above
the passband if there is a problem.
Al

1060. Re: PC RF getting into my HF rigs!!

Sometimes you can reduce monitor noise by changing the resolution.
Make sure your coax cables are routed away from the monitor. Try
placing one of those large ferrite beads over the monitor cable (many
monitors come with them all ready installed).

1075. Counter/Stabilizer PLL Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-11 00:00:00 UTC
From: Richard Hosking <richardh@iinet.net.au>
Message-ID: <01becbac$18be7120$711e3bcb@default>
Source record: 68717

I have built 3 versions of this now - the first two work fine but the third appears to have loop instability with the VFO wandering up and down at about 0.2 Hz. The VFO on this occasion used much less capacitance in the tank circuit but the VCO excursion was the same as previous at about 5 KHz for 0-5 V. Loop filter values are as shown at

http://www.iinet.net.au/~richardh/vfostab.htm

I have spent days trying to work out the problem without success!!!
Note that ther micro generates a 2 msec pulse for 10 Hz error up to a max of 10msec for 50 Hz error. Above this the loop unlocks. Each count takes about 120 msec which is the pulse repetition rate.
Any of you professional engineers/knowledgable amateurs out there can give me an analysis of the loop for stability etc as mine is obviously incorrect

Thanks in advance

One method I have seen (not tried) is to remove the cover from the monitor, and use heavy duty aluminum foil to line the interior. Not recommended for the faint of heart or for the sloppy kit maker as you must avoid any contact with the electronics once the procedure is completed. Don't for get to provide adequate ventilation.

I'm not familiar with the MFJ device, so forgive me if this is a bit off track.

I've seen small digital recorders (the type that store the message in solid-state memory rather than on tape) at office supply stores for a moderate price. You might find it less expensive to buy one of these and hack on it than to assemble the parts to build one yourself. This is often true when you want to build one of something which is similar to a mass-produced device.

Have you looked at Chapter 8 of the _ARRL Antenna Book_? An article you might find interesting is "The Simplest Phased Array Feed System -- That Works" in the _ARRL Antenna Compendium_, Vol. 2. I realize that ARRL publications may not be as readily available there as here, but I don't know of any equivalents to these in RSGB publications.

>Jim KY7DX

I had a problem with computer noise. Mine was coming from the monitor.
What I did was install a good single point ground system. Everything
on the operating table (rig, antenna tuner, keyer, scope,
computer..... everything except the monitor itself as it was housed in
nothing but plastic) was conected to a single point. From that point
I used a short length of #6 solid wire (ï¿½" dia copper tubing or bigger
would be better) was run directly outside the shack - about a 4 foot
run in my case. Outside the wire was connected to a single 8' ground
rod also connected to the ground rod was 12 - #8 solid copper wires
varying in length from as short as 12' to over 70'. These wires were
spread out from the ground rod as one would do with a radial system
and were buried about 2-3" deep in the soil.

After all was installed my noise dropped from about an S-7 to less
than S-1 on the meter. (My S-meter is about 3ï¿½ db per S-unit).

As a side note in connecting up some additional equipment I
inadvertently disconnected the antenna tuner form the ground system.
When I turned on the computer all my noise was back.. Reconnecting the
tuner ground confection resulted it the noise dropping back down to a
very low level.

So, based upon, my experiences I would recommend that you put is a
good ground system. The next thing would to obtain one of those DSP
noise filter units - they can help a lot.

I bought a half-dozen or so "3-msg/30 sec total" memo recorders from
/I believe/ Electronic Goldmine for Very Little Money.
I lashed up a prototype to see how well they would drive the mic line
and how good (poor) the audio would be. There was more than enough
audio to drive the mic line -- so, with an output level pot for control,
I did an On The Air test and received very good audio report(s).
Now it's on to designing some timing and control logic with a
Microchip Technology 16F84 or the such.
I not only want to build a "Dead Band CQ Caller", but, as well, a
"First and Third" caller for 2m SSB skeds. With the latter, I need
'accurate to the second' control with 60 second repetitions.

I've looked at the MFJ device -- and, for what little it delivers,
I can't justify spending _my_ money on it.

Ahhh, but it's Summer now and the Colorado Rocky Mountains beckon
more than the work bench. I'll get back at it this Fall -- I want
to have it ready for the November Leonids...

Yes thanks, got that Roy, those books are just as readily available as the RSGB ones here. Using eznec and I've seen the model you provided of that. BTW I made quite a successful 6 band quad (6 meters thro' 20 meters) modelled on eznec. If anybody wants the .ez file for that I'll attach it to an email.

Obviously you're one of those idiots who think "free speech" means "any
damn thing I want to do, regardless of how it affects others".

Obviously you can't defend your continuing, deliberate theft of the Usenet
shared resource, so you resort to a personal attack. You need to keep
attention off the bad thing you keep doing, so you point the finger at
someone else and make accusations.

READ the quote on free speech I sign off with. If you ever manage to figure
out what it means, you'll have one more reason to enjoy your misdeeds. It's
always more fun to hurt people when you know how much it hurts them.

I find Myself being content with just monitoring the ham bands and having
fun doing it.
As for talking I find My trusty CB always there if I need to talk or get
traffic reports
And there is no code test or for that matter any test at all...believe Me I
can pass the test
now no problem I just seem to miss the exam dates and loose interest for a
few more years
at a time.. working in electronics seems to make me less interested in
taking electronic theory
test just to talk on 2 meters...I would rather just sit back and listen . on
any band or frequency
I choose or scan several thousand at a time on one of six scanners rigged up
with antennas on my towers...I may in the future get My ham ticket if I can
ever remember the exam dates and times...I do enjoy listening just fine for
now and I am gathering assorted equipment for the future
when I will transmit..you may have noticed I am rather out spoken and would
probably just make
some snert mad and I surly don't won't that to happen on the air!. I know
some really nice Ham operators and listen to them often, Even helped some
with technical problems with there stations, Beside I can talk on here and
No one can Key on Me !! 73's from Ga.

This ain't quick or dirty but you might consider a laptop. If you're running simple stuff like logging and pactor ect. a 486 will usually work, and they're going at swapmeets for $50 to $100. Those LCD screens are real quiet...

1097. Photo-etch

Hello all,

I have been making and supllying PCB's for quite a long time but I keep being asked for PCB's with "solder resist". I have ben searching the net for suitable materials and there is no-way will I start mucking about with silk-screening.

Does anyone know of a solder-resist material that can be used with simple photo-etch methods; ie. a spray-on photosensitive solder-resist material that can be developed in the normal manner using a weak alkali solution?

Has anyone tried using normal photoetch-resist as a solder resist? I would think that it could work but may not be so durable.

Best regards from Harry - SM0VPO

Although it doesn't concentrate on microwaves, Hawyard's "Introduction to Radio Frequency Design" sounds close to what you're looking for. It's available from the ARRL. There's also quite a bit of good information in "The ARRL UHF/Microwave Experimenter's Manual".

"Microwave Circuit Design Using Linear and Nonlinear Techniques" by Vendelin, Pavio, and Rohde (Wiley, ISBN 0-471-60276-0) is a standard, although it's perhaps a bit on the "academical" side.

There are two companies that I would reccomend: "CirKit" and "Mainline", both of whom are resident in the UK and other countries around the world (and I have no financial interest in them or any other company).

Mainline are almost certain to stock them since they specialise in RF devices. They even stock HF RF PA ferrite transformers as is found in most commercial rigs. They are not a suitable source if seeking common transistors such as the 2N2222 and the BC547 etc. Mainline Electronics Supply, Inc., 2430 Von Esch Road, Joliet, II. 60431 Tel:(815) 436-3900, Fax: (815) 436-1959. I do know the UK branch has these devices.

CirKit (Broxbourne) have larger stocks of the more common devices and components including many common RF devices so they may have yours too. It is well worth getting their catalogue and you can contact them at: CirKit Distributions Ltd, Park Lane, Broxbourne, Hertfordshire EN10 7NQ . Telephone +44 (0)1992 441306, Fax: 01992 471314.

Best regards form Harry - SM0VPO

The ARRL has "UHF/Microwave Experimenter's Manual" and "UHF/Microwave Projects Manual".

They are both excellent and practical.

Try the ISD chips they come in various flavours, you can trade
sampling rate (speech quality) against recording time.

The chip contains all but a few external components and works very
well has built in A/D-D/A, eeprom and audio output amp. I guess the
price would be something like 10 USD for the ISD1416 or 1420, this
gives you 14 or 20 seconds of memory that can be segmented in up to 64
parts!

There is a bigger brother the ISD 3000 series with up to 180 seconds
recording time and costs 25 dollar.

The most spectacular thing is the messages are stored in EEPROM which
keeps the data even when power is switched OFF!!

You need a micrphone, some resistors a few capacitors and some
switches to complete the design! If I recall correctly the article was
written i QST some 10 years ago. Keep looking

Good Luck

National semi makes a neat little 10 step voltage divider chip - I think that it's the LM3915 or LM3916 - they have three - one with linear steps, one with 3dB steps and one with VU type steps. The chip easily interfaces a LED bargraph or discrete LED's. Just replace the meter in a canned design with the LED's.

While going thru the junkpile at the office several interesting
devices were found. I have "lmited" space (my "interesting stuff"
space is full) so if you are interested in any of these gadgets please
respond IMMEDIATELY as I do not know when they ship the stuff for
destruction, it might be tomorrow.....

1 complete Polaroid camera with optics for older (and newer)
oscilloscopes

1 complete Polaroid camera with options for older (and newer)
oscilloscopes, in wooden box like new!!!

1 old Polaroid camera with fold-out optics used but problably OK uses
same film-pack as the above???

2l HP 9825 BASIC instrument controller + plotter + printer.....

2 HP5110 (?) HP-IB to fiber optics converter plus fibre optic cable
one working one is not

1 HP 5105 Direct synthesizer, the grand-dad of all direct synths
problably working

Most of these items are HEAVY as you know and shipping is difficult!
The items are in Link&#65533;ping SWEDEN. Let me know if you need/want the
stuff and if you care to offer some cash for my trouble!!

Hurry, on friday it's probably to late!!

contact me at lasse.moell@swipnet.se.nospam

and do delete te nospam in my mail-adress

I HATE TO SEE GOOD WORKING INSTRUMENTS BEEING SCRAPPED!!!!!

1116. Forgery? [was: "LPWS 10k! 8401"]

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-12 00:00:00 UTC
From: John Mock <kd6pag@qsl-nojunk.net>
Message-ID: <87so6tbwk0.fsf_-_@mongrel.kd6pag.ampr.org>
Source record: 68662
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,uk.radio.amateur

The pirates are, unfortunately, alive and well on Internet as well as
on amateur radio!

The above item was not published by or on behalf of myself. Any
message issued by me originates via demon.co.uk

However, the place to complain is the Internet Service Provider (ISP) of
the offending user, e.g. 'mcmail.com'. This information can be found from
the 'Path:' field of the full header:

From: bajones@worcester.demon.co.uk
Newsgroups: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,
uk.radio.amateur
Subject: LPWS 10k! 8401

ews.demon.net!demon!peernews!news1.mcmail.com!195.44.2.37
Lines: 13
Xref: vnetnews.value.net rec.radio.amateur.equipment:118235
rec.radio.amateur.homebrew:48411 rec.radio.amateur.misc:184106 uk.radio.amateur:55297

The customary address to complain to would be 'abuse@mcmail.com', and if
that fails, try 'postmaster@mcmail.com'. Be polite, firm and direct.

When you complain here about an individual, you are posting off-topic, which
is also inappropriate to the newsgroups you're posting to. If you have a
net abuse problem, then bring it up in one of the net abuse newsgroups,
where such things are discussed; not here. Complain to the ISP, who can do
something about it, not to us.

-- KD6PAG (Networking Old-Timer, "RF Newbie")

P.S. If the ISP is not cooperative and the abuse is very serious, then
complain to the upstream ISP. There are also some other ways of dealing
with such postings, but such methods may be as questionable as the original
posting...

Attachment: 'traceroute' showing responsible ISP for offensive posting.

Look in the ARRL Handbook and Antenna Book, especially for the
"Double-Ducky" (very adaptable for what you need), or in "Transmitter
Hunting, Radio Direction Finding Simplified" by K0Ov and WB6UZZ published
by TAB Books (ISBN 0-8306-2701-4). Very good stuff in all 3.

73, Laszlo KF4PV/3

1118. Re: RTTY decoder software

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-12 00:00:00 UTC
From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Message-ID: <7mdel0gcl4@campus1.mtu.edu>
Source record: 68664

This is correct. I have found the people at Maxim to be very helpful
when requesting samples of there MAX232/E series of chips. These
perform the voltage level conversion quite well.

On Wed, 07 Jul 1999 20:08:43 GMT , ve6inm@telusplanet.net spewed forth to
rec.radio.amateur.homebrew:
:vtn>The serial port (COM) on most PC's runs with RS-232 standards. That

==========
Most of these units ,as the talking greeting cards use parts made by
ISD (Information Storage Devices Inc.)
San Jose, CA 95134.
They are called Single-Chip Voice Record/Playback Devices

ISD1000 Analogue Storage ICs
Model ISD1012A 12 seconds recording/playback
1016A 16
1020A 20
3 pcs in cascade give 1minutes recording/playback

These ICs can among other purposes be used for a 'parrot' repeater.
Has been published in QST
They are ideal for 'lazy' contesters providing pre-recorded short
messages ,like CQ Contest KX6XXX

They are also available in Europe, incl UK
A good article on basics : Electronics + Wireless World ,Feb 1992 ;
pages 110 thru 113

Ramsey is making a kit based on the unit featured in the last couple issues of QST. The article has enough info to make your own if you want to go that route. I hope to get my Ramsey unit finished in time for our hunt this weekend.

As to antennas, my favorites are the ones made from pvc with metal measuring tape for the elements. They are detailed on a web site, but I don't have the url handy. If you don't find it with a simple search let me know and I'll send it to you. If you have a dual band receiver, make yourself a "440" version of the tape antenna. You can hunt for the third harmonic when you get in close. It works great.

>tvendt@kear.tds.net
>Thanks in advance
>Tim KB1MM

There is no relay in the 706 series. Pin 3 is connected to a
transistor and it goes low to less than 1 volt when you press the PTT
button of the mic or press the CW key. I would use an opto isolator
connected from 13.8 volts to Pin 3 then do with the output as you
require. Almost every time you connect a relay directly to Pin 3 you
will blow the internal transistor unless you protect for the back emf
generated by the relay with at least a snubber diode.

The Pin 3 can only sink a maximum of 20 mA as listed on page 6 of the
706 operators manual.

Ameritron has built up a two transistor switching device model ARB-702
which works well with the 706.

Hope this helps

Hello All;
I'm in search of a short section of "flat coax" HF feed (for 20M
operation;possible
100W transfer energy) that can be tightly pressed between a vehicle window
and
the adjacent rubber seal. The wife has make it very clear there will be no
holes
added to "her" :-) van for a direct coaxial antenna feed.

Any suggestions, ideas? Do such items exist?

Currently, the side window pressure fit to surrounding rubber appears to be
so tight
as to not provide the space necessary to accommodate the smaller Beldon 58/U
coax without possible overstress of the surrounding glass.

Suggestions, comments would be greatly appreciated.

Thanks in advance,

Dave Green

Hello one and all...

My name is John, K4JJM, and I'm fairly new to ametuer radio... I'd like to learn a little about radio circuits and basic (very basic) electronics. I'm a computer programmer by trade and have a very limited knowledge of the actual hardware under the hood.

I'd like to learn about RX/TX circuits and how they combine to receive/transmit radio signals.

Does anyone have suggestions (I know I'm asking for it now!) on books that I might look into to learn the basics of radio circuitry without spending a couple of years learning the theory behind it all? I'd like to find something with hands-on applications. I've been concidering the ARRL Handbook, but I wonder if it might be a bit advanced for me. I'd like to find something that has usefull projects to apply the circuits that I learn... I don't want to build a remote switch for a lamp or a digital egg timer!

I'm interested in QRP and I'm in the process of learning my code to get privileges on the HF bands. I would like to build a simple receiver and eventually a QRP transmitter... Any suggestions?

Also, what type of test equipment will I need to start this "hobby"? Are there good kits/projects available for some of the test equipment? I all I have right now is a digital VOM and a cheap soldering iron... I'm sure I will need much more to be proficient! But just like everyone else... It's hard to justify "hobby" expenses to the household "Chief Finance Officer"!

Thanks,
John... K4JJM.

Yup, you gotta wonder why you did it in the first place if you now find it so boring. What do you actually do with radio? Have you made any friends? tried building anything? pushed yourself to learn something new and hard? Do you volunteer to help out at service functions? I see you're a technician. Were you hoping for world-spanning communication? if so, try upgrading. Read the ARRL Handbook for ideas on things you might do. Does it bore you to read that? Maybe you're not cut out for amateur radio in the first place.

So - ask yourself - why DID you get that license?

1143. Downconverter Solution Using Off-the-Shelf Integrated Circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-13 00:00:00 UTC
From: lagniappe <lagniappe@my-deja.com>
Message-ID: <7mftia$p6g$1@nnrp1.deja.com>
Source record: 68598

If there is anyone familiar with the current offerings of RFIC manufacturers, I would appreciate your help.

I'm designing a block downconverter (fixed LO) from 1.2 GHz to 440 MHz. My application is low-power battery-operated mobile. I will build it into a small housing on the inside portion of a glass-mount L-Band antenna, with a small probe to retransmit the signal in the 70-cm band. You can think of it as a one-way transverter with microwatt output power.

The idea is that I'd just reach up and turn it on, then use my 440 HT to listen to 1.2 GHz inside my car without having to remove the rubber-duck antenna. Actually I can't remove it, since it's an Alinco DJS-41T. Since the range will be only a foot or so, a power level that would be undetectable across the street should work fine.

In keeping with the small size and low-power requirements, I was wondering if there is a commercial IC that I might make use of, maybe something from a 900-MHz or 2.4-GHz cordless phone. Ideally I'd like something with minimal off-chip components (maybe just L-C filtering for RF and IF), built-in PLL/VCO with frequency stability using easily-obtained crystal, reasonable NF at 1.2 GHz, and, of course, available cheap on the secondary market.

What is out there that I should be looking into?

best regards,

Martin

1144. Helical Antenna question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-13 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <378B64A7.5460B82B@midwestmicro-tek.com>
Source record: 68599

I live in an apartment so I don't have the room for a big antenna. I'm only interested in working 80 and 40 meters so this makes for even more problems. I looked into different designs for apartment dwellers and I think that the helical is the best for my situation. My question is, can I wrap both the 80 and the 40 meter on the same form and then switch between them?

1145. S-meters... Where do they go?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-13 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>

First off thanks to every one who responded to my Tansmitter Design post, I got a number of good leads and David sent a lot of good stuff, thanks guys.

Okay, I'm building the Mate to the Mighty Midget from a 1966 QST magazine article. I want to add an S-meter to it and the design that I have needs to be hooked into the AGC circuit, well the MMM doesn't have an AGC. It does, however, have a 20k pot to manualy adjust the gain. Where should I hook the S-meter into?

It is worth having the ARRL Handbook. It has both basics and advanced material. Even if it looks too complicated, it's a great reference to have around as you deal with simpler material that leads you to ask questions.

However, the Handbook has gotten quite expensive in recent years. You might be able to track down an older edition for significantly less. I picked up a 1969 edition two months ago for fifty cents at a local library used book sale. The basics have remained the same after thirty years, though that is pusshing it's usefulness to a beginner. A ten or fifteen year old edition should probably still be useful, especially when the price drops a fair amount. Hamfests are a good place to find them, along with other used electronic books. The ARRL keeps a list of upcoming hamfests at their website at http://www.arrl.org

You might also find a copy at your local library. Not as convenient as having a copy at home, but quite a bit less expensive. Once you've borrowed it a few times, you'll either feel it really is beyond you at the moment, or find that it's something you do want around.

The ARRL has some less expensive books that you might find more approachable. Doug DeMaw's W1FB's Design Notebook looks like a good starting book. I say "looks" because it's been so long since I was a begninner I can't really judge.

His W1FB's QRP Notebook is along the same lines, though I'd say it's aimed at a somewhat more advanced readership.

Neither of these books are detailing full projects. There are simple receivers and transmitters, but the detail is mostly the schematic.

QRP Classics from the ARRL is a collection of articles from QST about low power equipment, and the stuff tends to be simple. Because they are complete articles, they probably are more useful to someone starting out. I think it's out of print, however. QRP Power is the replacement, with mostly different articles. Though the equipment seems more complicated than in QRP Classics.

An important trick to saving money is understanding the circuitry. Then you can scrounge up parts and use what you have rather than track down the exact parts in the article and pay full price for them. This takes time and experience, but in the end it's worth it.

The first few things I ever tried to build did not work, and I did not have the experience or knowledge to figure out what was wrong. In retrospect, I suspect my lack of soldering ability had a lot to do with it, but I was also burdened with some substitute parts that the counter

clerk at the electronic store made to help me save some money. Who knows if they were really suitable substitutes?

The first thing I got to work was a code practice oscillator that I built by twisting wires together (which did not make it very transportable). The parts for it came out of a table radio and the transistor came from a "computer circuit board" (this was in 1972). I actually cut up the board to get the transistor, rather than desolder it. The fact that it did work pushed me further. The fact that I had somehow picked up enough to know I could make things without exact parts (and learned enough to pick parts that probably would work) allowed me to make the attempt.

You might consider all first projects to be throwaways. Use them to learn to solder well, and learn from experience. Try to scrounge parts, be it from discarded equipment or from fellow hams, and the cost will be low enough that any problems will not be a problem. Concentrate on getting the electronics working, not a fancy case that will add considerably to the cost.

How about going through the rubber gromets in the firewall or a rubber
drain plug in the floorboard (sometimes under the back seat) or behind
the seat into the trunk. Never heard of any flat coax.

Hi Michael -

Actually, they're quite useful indeed. The 'pad per hole' boards allow you to solder most PCB mountable parts easily. Then you wire point-to-point using any of a variety of techniques. I happen to like using an 800 degree F soldering iron tip and around 30 AWG magnet wire - the heat will vaporize the insulation and allow soldering directly. The microprocessor controlled Engine Monitoring System for the Rutan / Yeager Voyager (World Flight, 1986) was built just that way.

So what does the protoboard provide in all this? By soldering the parts in, there are no flea clips or kluges to keep them well mounted. Many such boards have a continuous ground plane on the component side that is easy to use for any pins that need grounding. You don't need to drill holes or have to connect only to the various device pins (the pads make soldering much easier).

Give 'em a try - you may be pleasantly surprised!

Jim Horn WB9SYN/6 Been building circuits for 30+ years...

Why not use a balun and twin-lead and an antenna with 300 ohm impedance?

Buying your own van would be cheaper than divorce.

Get some scrap plexiglass approximately the same thickness as your car
window. Trace the shape of the window's top edge onto a piece of
cardboard and then cut three sections of plexiglass the same shape as
the hole that is formed when you roll the window down about an inch.
Glue these into a sandwich with your favorite sticky goo such that
they form a "pocket" that seats nicely to the top curve of the
window. Drill hole for the coax in the plexiglass and then wedge it
into place by rolling the window up to clamp it between the top of the
window and the rubber seal. If you don't want to trap the plexiglass
onto the feed line, you can make a slot instead of a hole, but a slot
will leak more.

Hi

I lost the URL of a commercial page that had three different loops for sale.
It showed pictures of them with specs and prices, the largest loop was made with 5" diameter aluminum and had a very high Q. The picture showed the loop above a forklift truck.
The company made other antennas also, the loops were only part of their site.

Thanks for your help
Mike

I'll give it a try, but not sure I've got the picture. So, you solder the part to the pad, and then "melt" wires into the solder blob?

Michael.

The s meter can go on the agc bus, usually requires a DC amplifier for operation. Second place is in series with agc controlled IF stage in series with the plate B+ feed. Meter will read "backwards" in this application. S meter readings are based on the developed AGC voltage. If the set doesn't have AGC, you can't expect the S meter to work.

Welcome back, Bob.

For information about the ARRL Handbook, QST, and other League publications, visit http://www.arrl.org, or call 888-277-5289 (publication sales desk) or 860-594-0200 (ARRL general number). You can get back issues of QST on CD-ROM but I don't think this is true for the Handbook. One of the out-of-print book services might be able to locate an old Handbook, and ham conventions or flea markets are always a good place to look.

CQ Magazine is alive and well. Their web site is http://members.aol.com/cqmagazine, phone 516-681-2922.

Both are on the East Coast.

There are several sites on the net with info on converting the MASTR II.
Go to a search site like www.mamma.com and search on "mastr".
Some include how to read the model numbers. In the case yours isn't
a low band VHF, as it will cost a bit more to get on 6 mtr starting with
a UHF model [;>}

Source record: 68678

Hi.... I have an IC-706 that won't key an amp. I built an interface for it but it seems that it may have been used on an amp that drew more than 20ma and probably blew the t\r switch in the 706. Does anyone know if the tr relay is a mechanical relay or are they using a transistor switch. if you have any info on this it would be appreciated. I don't have a service manual for this but I am technically adept (more or less).. I fix pro-sound gear for a living... if this has happened to someone in the past and you have fixed it, please let me know what you did.... one of the tests I have done is to measure the resistance across pins 2 and 3 on the 13 pin din plug keyed and unkeyed and the resistance doesn't change from several megohms. It should drop to somewhere around <1 ohm.... if i short pins 2&3 together, the amp keys to TX. Please e-mail me at ....
tvendt@kear.tds.net
Thanks in advance
Tim KB1MM

Source record: 68533

I suspect you'll have to have something more sophisticated than you have planned. Making the leap through the glass and to the rubber ducky may require more power at 440MHz (ie it would be more like a translator in a satellite) or some sort of coupling from the output of the converter to the rubber ducky.

As for the actual converter, I don't know if they have exactly what you need, but I'd check Maxim. I've ended up on their mailing list, and I've seen some very interesting front end IC's described recently. I can't remember whether any had a synthesizer built in.

Maxim Integrated products
120 San Gabriel Drive
Sunnyvale, CA 94086

They are worth checking anyway, since I've seen a number of RF-related IC's, and a while back they had an article on a phasing transmitter. I've never checked it, but they have a website at http://www.maxim-ic.com

1181. Re: Wanting Info On Maxon 49B5 Conversion

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-14 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.SOL.4.10.9907130049260.22122-100000@Ocean.CAM.ORG>
Source record: 68534

A couple of years ago, Hugh Duff in Ontario (I forget his call) made some comments here about a Radio Shack 5 channel 49 MHz walkie talkie. The results of his exploring was that the synthesizer IC was hard wired for specific channels, and there was no easy way of modifying it. I suspect one could find the post on http://www.dejanews.com

I picked up a broken Radio Shack multi-channel cordless phone (and they must have great similarity with the walkie talkies in terms of RF circuitry) and it uses a Motorola MC145166 IC as the PLL. I don't have any info on it at hand, but with 16 pins I suspect it's not user programmable.

However, beyond the synthesizer, it should not require much work to move a 49MHz walkie talkie to six meters. A little retuning, and at most some reduction in capacitance across the front end coils. I think people have reported here that they have moved the crystal controlled ones to six, with little effort beyond new crystals.

I have the schematic for one of the Radio Shack single channel units, and while they are low power tranmistters, the receivers are fairly goo looking, with a first IF (and simple ceramic filter) at 10.7MHz, and a second IF with another ceramic filter at 455KHz. They use a standard Motorola double conversion FM IF IC, as does the cordless phone.

My humble suggestion is to use teflon miniature coax aka RG 178, RG 196 and M17/169. Diameter is 1.8 millimeter.

This cable will withstand 100 watt (do NOT use the more common none-teflon RG174), use as short cable as possible as it's pretty lossy.

But I doubt you will find any thinner cable with controlled impedance!!!

Cheers

I use RG-174 in my baluns, and they handle 300 watts at HF with no problem. It wouldn't be a good idea if the SWR is high, though.

Convert to a couple of inches of 20 gage twin speaker cable. Neither
the transceiver, antenna or XYL will notice the slightest difference.

Does anyone know where I can get a digital controller board for the
TS- 930. It is the board that is mounted directly under the internal
speaker. Mine has finally bit the dust after mounts of redoing and
redoing soider joints. I hear that there is a reengineered new one out
there that will operate via the computer as well as manuelly. but I know
not where to find it. Can anyone help me? Thank you you can email me at
oris@dirtball.com
Thanks
Oris

How I wish I could say that from time to time. I am fully occupied designing and building circuits, speaking to people on the radio set with home-made equipment. I even speak to my brother in England every second day. I have learned how to make printed circuits boards and I get loads of E-mail every day. I even have fun laughing at some of the idiotic mail I get - http://sm0vpo.8m.com/info/fasq.htm

If you take a peek at http://sm0vpo.8m.com I'll bet you are still not bored. Have you ever thought about joining a club? There you can meet other people who use ham-radio in combination with other pastimes such as camping, boozing, boating, publishing, etc.

If you are still bored then I suggest you take your equipment, pack it up nice and safely and send it to me. I will certainly have fun with it.

Not-so-bored - Harry

Well Tim
I have had the same problem with my Clipperton L. I used the band
switch out of the heathkit SB 220. I works a whole lot better than that
peice of crap that Detron put in there. I also replaced the parasidics
in the process. I got the band switch new from Nebraska parts. It was
alittle high but well worth it. There is one problem though. In
replacing the band switch I did away with 10-meters. The switch doesnot

have the conectors for that postion. You could always make up a external switch for ten. I choose not to do that because being that the amp doesn't have a 10-meter position I can sell it to anyone. I'm haveing rig problems right now. The digital board in my TS-930 has craped and I need another one. My news server is fozen again. So I haven't been able to put out a want for the board. Do you think that you can help me? Heck I would trade the 930 and the clipperton L for a TS-940 Well I hope that I helped you

You can find the circuit and article at:
http://sm0vpo.8m.com/use/baycom.htm

You can download the PCB at:
http://sm0vpo.8m.com/down/baycom-cct.zip

You can get the TCM3105 and PCB together as a package from:
http://sm0vpo.8m.com/info/kits.htm
(I still have a couple left, but not until after the 01st August -
holidays)

Best regards from Harry - SM0VPO

Isn't there a source of spray on conductive coating? I seem to recall that this stuff which is packaged like spray paint, put down a few mils of shielding.

Spray the inside of the monitor case. Neater and safer than aluminum foil and doesn't block the ventilation.

Unfortunately I don't remember the source.

Which got me wondering, are you better off adding a connector at each end
or could you simply splice the sections together overlapping the shields
then sealing them with heat shrink or somthing similiar. Would it make
any noticable difference in performance? How about at 6 or 2m?

Interesting, I realize that gain can be a bit of a personal choice i.e. how much gain is needed to get the signal quality that you like. However couldn't I get fair results by connecting the S-meter to the gain output of the 20k pot?

I was wondering what is the maximum voltage battery pack I can use on this radio? Does the battery pack from a HTX-202 fit this radio? Can I use the radio while it is charging? Can I hook it up to an external 13.8V power supply? Sorry for all the questions but I am fairly new to Ham Radio and just bought this radio used with no manual, so I wouldn't want to break it first thing.

Message-ID: <7mik1d$3qa@dfw-ixnews19.ix.netcom.com>
Source record: 68552

No, it won't. Various RC phase shift networks will have their own sets of design equations.

In fact there are generally more independent variables [unknown element values] in such networks than there are dependent variables to be satisfied. The network that you suggest does not have as "nice" a "solution" as the twin tee design, but then that is a question of "art".

For instance, as you can see in the twin tee network, there are six different circuit elements each of which could have a unique value, but in the solution that I have shown there are really only two values R & C specified to yeild a given notch [oscillation] frequency. Even then, the value of one or the other of R & C is still arbitrary. Only their product is specified by the notch frequency! You must arbitrarily choose one of them from other considerations, usually the value of C. Usually one would choose an appropriate capacitor value C first with respect to availability, cost, and size of capacitance relative to expected circuit parasitic capacitances [i.e. this would set the generally expected impedance levels in the circuit], and then calculate the corresponding R value from the notch frequency formula that I have given.

There are actually an infinite number of value sets for the elements of such networks which would satisfy the conditions for oscillation in an amplifier feedback loop. To find a particular solution, arbitrary values or realtionships must be assigned between the elements and then set or fix only two values to satisfy the two conditions for general impedance level, and desired frequency. And so . . . as in life there are a lot of choices. This is what often makes analog circuit design more of an art than a science, heh, heh. Too many choices! The good news AND the bad news, heh, heh.

It is my opinion that the twin tee circuit that I have chosen to show you with the given element value relationships contains some "nice art".

But there are an infinite variety of other choices!

BTW. . . . IMHO, a better RC oscillator design would be the classic one using the Wein Bridge, per the original Bill Hewlett and David Packard design. The Wein Bridge [patented] RC oscillator that started Silicon Valley lo those many years ago! Bravo Bill and David, and thanks to Fred Terman as well.

Cheers,

Peter AB4BC

> 73,
> Mike, KK6GM

I think occasionally there were some construction projects that went straight into QST, but they are the exception. The one that I can think of is the 1977 Handbook. There's a receiver by WA1JZC that I never saw in QST, and I was getting QST monthly at the time. There's also a project a few pages earlier for adding bandpass tuning to an existing receiver, and I never saw that in QST either.

One unfortunate thing that the ARRL did was not include a reference to the original article when reprinting something in the Handbook (or the other ARRL books for that matter). Sometimes they did it, but not consistently. Sometimes it seems like articles are truncated, I've even seen it mentioned that readers might want to refer to the original article, and it would be nice to know when the article originally appeared.

A while back, when the QSTs on CDROM came up, someone mentioned that it would be nice to see old Handbooks on CDROM. I'm less certain there is a need for that, since virtually all of the projects did appear in QST and the Handbook itself changes relatively little from year to year. An interesting project would be to issue a CDROM with an index of when projects appeared in the Handbook, and what issue of QST they originally appeared. Throw in the projects that only appeared in the Handbook. Probably there'd be room to put in sample material from various editions of the Handbook, maybe one a decade or whenever there was major change.

And perhaps it's worth putting out a CDROM with the contents of the various books put out by the ARRL in years passed, despite them mainly being reprints of QST articles. The first, and maybe more so the second, edition of the ARRL's SSB manual is still a good reference on SSB, particularly the phasing method. As something becomes more mainstream, it ironically can become harder to find information, since everyone assumes that everyone knows about the topic. The old Mobile Manual, though the projects might be dated, might still have useful information about keeping your car quiet, and should carry useful info about antennas. Or it would be nice if the ARRL did the same as I suggest for the Handbook, and at least detail what's in each edition and where the projects came from.

>Where should I hook the S-meter into?

No AGC, no S-meter. S-meters work by monitoring the AGC voltage,
if you don't have AGC, then there's no AGC voltage to monitor. So
if you want a S-meter, you're first going to have to add AGC to the
receiver.

>very low level.

You know what that was telling you, don't you? It was telling you that you have common mode problems with your antenna system. The noise was traveling up the coax outside to the antenna, then coming back down the coax inside to the radio. Grounding is a bandaid approach to solving this problem. The correct approach is to resolve the common mode problem, ie use a proper choke balun and resolve any antenna symmetry issues.

It is often the case that grounding as you have done will simply make RFI problems *worse*, depending on feedline length, operating frequency, etc. Grounding isn't an RFI panacea. I mention this so that some of those who follow your advice won't be too surprised if it causes their RFI problems to worsen instead of improve. (It can do either depending on the particulars of an individual installation.)

GC Electronics sells it. But it can *flake* off and cause
an unexpected short. It is a good idea to use fish paper
as a barrier between any conductive shielding and the
HV circuits of a monitor.

the max voltage for the IC-2at is 8.4 volts unless you have the 12v adapter pack with it. yes the 7.2 volt HTX-202 packs will work fine with it.. the HTX-202 was redeisgned from the ICOM IC-O2AT.

Hello Mike,

It surely wasn't the case. Less than half of the Handbook construction articles were QST articles. The majority were done specifically for the Handbook, and never appeared in QST. Most of the bigger projects were and are done specifically for the Handbook.

I have the Handbooks from '48, '49, '52, '55, '57, '62, '64, '67, '71, 78, '79 and '88, and they all follow this pattern. Also have every QST from mid 1944 to the present, plus most of them back to 1926.

Obviously you've confused sociopathy with anarchy. You've also decided that
the news admins no longer have any control and that the users are in charge.
You also don't understand the consequences of a war between users and admins.

Feel free to have the last word. This is off-topic and I'm quitting.

Actually, you could run the signal through one of the Analog Devices log amps and to the meter from there. That way, you could be the first kid on your block, and probably the state, to actually have an S meter that reads 6 dB per S unit. (But you probably wouldn't like such a "dead" S-meter.)

What you are looking for is some RG-174 coaxial cable. The total diameter is similar to the center conductor of RG-8 (just the metal center, not the dielectric) and is very useful in "Tight Fitting" applications. You should be able to acquire some with the appropriate adapters/connectors through Mouser Electronics or some other vendor. Works great but is very lossy if to long of a length is utilized, so keep it as short as possible.

And the electric companies or whoever have calculated that the money saved by making the light bulbs longer lived (and hence put out less light) is more than offset by the additional power needed to get the same light level, and also by the inefficiency of the bulb.

So it's better to use the 750 hour GE blubs that are bright but don't last as long.

Better yet, just buy one of the fluorescent replacements, if you can stand the two or three seconds it takes to get one started.

Thanks for the info, it is much aprecated. There is a similar type of phase shifter using a series string of 4 caps with a resistor (3) to ground from each juntion between caps, will this formula cover this type as well? -- dr.d Kiss Technologys The more complicated the plumbing the easer it is to stop up the pipes M. Just put a WTB on this newsgroup and some of the other associated groups
like rec.radio.swap, rec.radio.amateur.equipment etc., and you should be
able to turn up a few.

1227. WTB: QRP Club kit(s)

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-14 00:00:00 UTC
From: BamBam <kl0an@my-deja.com>

Source record: 68628

Hello everyone,

I'm looking for a QRP transciever kit to build. I'd like to find a KnightSmite or Tixie in complete kit form. I know the KnightSmite isn't offered anymore but, if someone has one still in kit form, I'd be very interested in taking it off your hands. Or if you know of another kit in the same price range as these two kits, I'd love to hear about it. I already know about the Pixie II and that is my fall back kit for right now.. If I don't find another one, I'll buy that.

Also, looking for a kit that a club could put together and have an evening meeting for assembly. Then possibly put kits together and market them to the QRP community in kit form.

Does ANYONE have any ideas on any of this? Looking for kits and ideas..

Drop me an e-mail if you know of any good kits.

Bob:
Slickest source for back issues of QST is a CD-ROM series called QST View published by ARRL that goes back to 1915 trough 1994 in eleven sets. Each page - articles, ads and all are reproduced in an easily searchable format. ARRL charges about $40 a set (five or ten years of QST) but I have seen them offered cheaper at some ham stores and hamfests.

Source record: 68631

But let's not forget that only rec.radio.swap was set up to be a buy and
sell newsgroup. That's the one where an ad should be placed.

I've never seen used handbooks at used bookstores, though I suppose in
some regions it's a possibility. Like ham magazines, they tend to sold
off direct6ly to the amateur market.

The ARRL on it's website at http://www.arrl.org has a list of upcoming
hamfests, and a hamfest is a likely place to find a used handbook.

The site also has a list of affiliated ham clubs, which might also be of
use to someone getting back into the hobby.

On the other hand, things seem to be changing a bit since recently I've
found Handbooks at used book sales. Last year I picked up a 1971 edition
at the local Rotary Club garage sale for twenty cents. It was good to
get that since it was the first Handbook I ever bought, and I gave ait
away a few years later thinking a later edition would be fine.,

And two months ago I picked up a 1969 edition for fifty cents at a library
used book sale, along with an RCA receiving tube manual.

Subject: ** FLEA at MIT ** This Sunday July 18th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 18th 1999
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)

MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

I did see one Palomar rx-amp with tr-switch using RG174. Not sure if
it was exposed to high SWR or more than 100 Watt but the coax was
totally melted....

I find using teflon-coax is so much simpler and reliable as the
insulation on the 174 tends to melt very easy....

But then again, IF it works well stick to it! No need to change!

Cheers

Unfortunately, as long as you're using a CRT you're stuck with the noise. A Tempest lab I was once associated with did some tests and found that even if the monitor case was completely metal (and well grounded) there was still major interference because of radiation through the CRT face. The only way to attenuate this (and that's "attenuate", not "eliminate") was to cover the CRT face with a grounded metallic screen.

The best solution I've found so far is a laptop with an LCD screen. In fact, for digital HF modes I use a 10 MHz 386 monochrome laptop running on batteries. The low clock rate really limits the radiated noise, and when the power saver feature kicks in and shuts off the disk, etc. it's below the ambient noise on 80m, even without elaborate grounding schemes and sitting next to the HF rig fed with a longwire antenna.

I use 1980's vintage DOS-based software so that it will fit into RAM and not need a disk to run. A bit primitive, but it can keep up with HF CW, AMTOR, PACTOR, RTTY, etc. without working up a sweat. Of course, I do use Pentiums, Win98, Linux, etc. for my professional stuff. Good luck,

I have a NEC XV17 sitting 4 inches away from my Yaesu Ft-920, and on the
other side of the bench, I have a 19 inch Sony SVGA sitting about 6 inches
away from my Kenwood TS-790. I get no interference whatsoever from either
monitor on any of the bands - HF or VHF/UHF.

The computers are underneath the bench and are also only about 2 feet from
the rigs (both are home built 400 mhz. machines with a 100 mhz system bus).

Apparently, the noise issue is related to specific equipment and/or station
setups ?

At 300 watts and 1:1 SWR, the current is about 2.5 amps. At 14 MHz, the RF resistivity of the #22 center conductor of RG-174 is about 0.15 ohms/foot, so the cable dissipates less than a watt per foot. This isn't enough to raise the temperature of the center conductor to the melting point of polyethylene. The resistivity increases as you go up in frequency, but it should still be ok at this power level anywhere in the HF bands.

Voltage isn't a problem. RG-174 is rated at 1100 volts RMS, which is over 24 kW at 1:1 SWR.

Sure I'll stick to it. Been using RG-174 for baluns and other purposes for more than 20 years and have never had any problem up to 300 watts. It's poor for long runs, though. The loss at low HF is nearly as great as at the high end, due to current penetration of the steel portion of the very small center conductor strands.

I disagree! I have a budget Vision Graphic monitor 6-inches to the left of my IC-761 and not a bit of RFI on any band. Directly above the monitor is a 2M rig with no RFI and a 6M rig with no RFI.

CRTs do radiate out the face but not enough to get into a properly shielded rig. The most likely source of his RFI is radiation from the cables.

Ever heard of the 'carbon tax', coming your way soon?

They have the authority to bomb a country back into the stone age. Why not
steal money?

And where do you suppose the dues that are paid to the UN come from?
(Taxpayers)

As soon as that idiot, Herr Klinton, gets into the UN, we'll all be taxed
for "our own good", or "for the children", or some other nonsense.

Yeah, but a repeater normally has about 90 dB of isolation between
transmit and receive. So you'll have big time desense if your repeater
runs more than very low power. You need about 3 miles horizontal
separation to get 90 dB of isolation, or about 500 feet of vertical
separation.

Source record: 68499

I've been using a high temp tape for wrapping transformers and inductors.
We are getting low on supply and I'm looking for a source of 1/4" and 3/8"
tape to wrap bobbins.
The tape I have has the name Permacel on the core.
Any suggestions?

Mike

Have you tried this ??? If so what frequency and what kind of
antennas ??

Doesn't seem to work on the 220 band at a 20 watt level. Tried this
about 15 years ago.

Well, I was thinking of the difference in pedaling around in a
circle, vs. just pedaling along an arc. One advantage would
be that for acceleration you could push with both legs at the
same time. And the "gearshift" is almost trivial - slide your
cable up and down the lever arm to get the mechanical advantage
of a type 2 lever. And I think they have pretty efficient
drum/ratchet devices that you could get out of a catalog.

> Hmmm. I wonder why they went belly up?

Good question! Mind you, none of the above inventions are
included in this set - I think mostly I was paid to implement
stupid pointy-haired ideas a la Dilbert, or maybe I was just
working too cheap, and the companies were doomed anyway. Or,
I'm a jinx or a total f***-up and it's my fault. But I don't
really think I'm all THAT powerful! :)

Cheers!
Rich

BTW, any vulture capitalists want to try any of these?

I just recently moved into a new apartment, and the overhead light,
or ceiling light, had a lame little 7 watt chandelier bulb in it.
So, I figured I'd be really smart, and shelled out 13 bucks apiece
for a couple of 25-watt fluorescents (which are about 9"long) but
said they give the equivalent light of a 100-watt incandescent.

Installed them both in the fixture. Turned on the switch, and I
was almost blinded! Instantly - no noticeable (sp?) delay at all.
I ended up taking one of them out, and the one 25-watt instant-on
fluorescent gives me more than enough light for my computer room/
office/tech lab. But they are kind of expensive, but they probably
last a long time (this remains to be seen) and probably over their
lifetime they save enough KWH to offset the cost.

And I can take them with me when I move, and put back the stupid
little 7- or maybe 15-watt chandelier bulb.

Cheers!
Rich

30' horizontal doesn't work well anywhere =]
my antennae are 100' apart horizontal and 30' apart vertical.
even at the 5mHz split of 70cm, 20 watts causes noticeable desense.
the antennae are comet gp-15s. there is a nice gasfet preamp on the
rcvr
but the desense was noticed before.
mobiles never had trouble but i pride my system for it's abundance of
low power ht users. 2 500mw users and 1 10mw user.
desense must go =]
i have a handbook with isolation figures but they don't factor gain
antennae.

just my experience.

1255. Looking plans dualband (VHF/UHF) antenna for HT.

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-15 00:00:00 UTC
From: Alexey Lomazin <milker@onego.ru>
Message-ID: <378eb9eb.0@news.global-one.ru>
Source record: 68506
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

My frend looking plans compact dualband (VHF/UHF) antenna for HT.
The well known way is using 0.5 m whip (1/4 for VHF and 3/4 for UHF) - but it's not a compact antenna. I looking for plans some _real_ compact about 10 to 15 cm.

I think about anithing like this:

###---------[L1]---------[L2]---------

- BNC connector,
L1, L2 - coils.
Inductanse
L1 ~ 0.18 uH
L2 ~ 1.2 uH

Lenghts:
from BNC to L1 - 4 cm, L1-L2 - 4cm, l2 to end - 5 cm, common - 15 cm.

I think best matirial will be central isolator from coax (without central conductor, of course) - diameter about 4 to 7 mm with winding on it.

Is any erros in above?
For e-mail me plis remove /stopspam/ in my adress.

1256. Re: Crystal Load Capacitance

Newsgroup: rec.radio.amateur.homebrew

From: CDT <xctx@onr.com>
Message-ID: <01becf95$25c9a000$8032c8cf@ct>
Source record: 68507

The Crystal's load capacitance is the capacitance it sees in
the oscillator circuit. You can vary the load capacitance by
probably 30% without much fear of startup failure. Load capacitance
is really the capacitance the manufacturer places on the crystal
when it is calibrated at the factory. So if you want the closest trim-free

accuracy use the specified load capacitance. If you don't care about
precise accuracy the load capacitance can simply be
"close" and your circuit will still oscillate.

1257. TS50 ALC help

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-15 00:00:00 UTC
From: Doug <kf4abm@my-deja.com>
Message-ID: <7mjmai$4pp$1@nnrp1.deja.com>
Source record: 68578

Hi all,

The Kenwood TS-50 has a ALC jack on the back of the rig.
According to a QRZ review if I fed a negative voltage to
this jack I could vary the output power. The TS50 has
three power levels as with many 2 meter rigs, they are
10/50/100 watts. However, with this negative voltage as
I understood to be varried between 0 and -4 volts I could
get down to QRP with the TS50. I built a power supply
and tried this without success. I switched and fed a positive
voltage which also didn't work.

Has anyone else tried this? I got the rig used and it has
been modified. Was set up to 150 watts and TX out of band.
Does anyone know if these mod's would inhibit the ALC?

Thanks in advance for any help!

>first thing.

My -2AT manual doesn't specify a maximum voltage, but the BP-5 battery
supplies 10.8V (and 2.3W RF out), so at least that much is acceptable.
I don't think it's intended to be run direct from 13.8v.

I haven't tried it but I've read that batteries are interchangable
with the HTX-202.

Manual says NOT to charge battery while radio is on.

I had the same initial impression.

Unfortunately, while the proposal was made by people that clearly didn't know the difference between twisted pair and Twisted Sister, the UN Development Agency did make the proposal. It isn't a hoax.

It got written up in Wired.

The report is discussed on the Agency home page at
<http://www.undp.org/hdro/>

Read the agency's own press release about it at
<http://www.undp.org/hdro/E3.html>

Fire the people who wrote this proposal, shut down the agency that authorized it, then come talk to us about paying the debt when the money won't be used on wasteful proposals like this one.

Make sure you post commentary on their discussion page
<http://www.undp.org/hdro/converse.html>

Hi all,

I'm designing a 1-10 MHz Class AB broadband power amplifier, 50-100 W pulses, 10-15 W average into 50 ohms, for an ultrasound application. I'm having trouble finding a good source of output transistors, bipolar or FET, since most transistor manufacturers are deserting these low frequencies for the cellular band and above these days.

Can anyone recommend some good production transistors for this type of application? I would also welcome app notes or design schematics, but I do have a circuit already for NPN bipolars which should work.

Many thanks,
Gerrit Barrere

Sounds like your phase margin is inadequate for stability. The "spurs"
are likely to be the result of low-to-medium-frequency oscillations
modulating your VCO. You may want to increase the value of the resistor
that's in series with your loop filter capacitor.

Just about any device that's characterized for VHF/UHF will also work at HF, but you may need to be unusually careful about circuit layout, Z matching, and parasitic suppression. It's usually better to stick with the old rule of device cutoff frequency <= 10 * the maximum desired operating frequency if you have a choice.

It's amazing how many cheap, nifty RF power devices are available these days for 800 MHz.

No, I haven't tried an ultrasonic beacon. I've found camp 100% of the time, sometimes without using the map or compass I carry. A beacon would be useful for the last 50 yds, where attenuation and other difficulties aren't so great. Ultrasonic seems a bit friendlier environment-wise than the usual camper's beacon: a boom box at moderate volume. But you're right: I haven't tried it. And it has nothing to do with me thinking someone trouncing about with a loaded rifle should know how to find his way home.

Michael.

I agree with Lyle, I don't think that the body blocking approach would work all that well. I think your best bet would be to go to Radio Shack and get Forrest M. Mims "Engineer's Mini-Notebook" on communications projects and build the RF transmitter he shows.

If you want to get illegal about it, which I don't recomend as sooner or later some one will notice you and you will get sighted, just up the voltage/current and add a large antenna to break a number of FCC rules and you might get a mile or two out of it. He also gives circuits for simple receivers (or you could just buy some cheap am transister radios) as well. What you could do is put a directional loop antenna on the receivers and then "sight" through them to determine the direction of the beacon. You'd have to know the general direction back to the camp though since the direction could be 180 degrees from where you think it is. If you decide to build the receiver up to get a few miles out of it, on your head be it.

Some one correct me on this if I'm wrong but I think that basement and sub-basement bands (i.e. 20,000KHz and less) are open and free to be use by any one for anything since they have no real value commercialy, although I think submarines use long wave when communicating while submerged. I remember reading an article on this in Popular Electronics or Radio and Electronics in the early '90s. The power neccessary to transmitt great distances is commercialy prohibitive, information content is low (but is fine for CW) and QRM can be nasty but you can build and transmitt on some of the frequencies (I think) without holding any kind of licence or having to have permission from the FCC.

Computer clock oscillators are not usually
adjustable/trimable. See the two metre CW
transmitter and six metre RX converter on
my web page (address below.)

Computer CPU cores run at several
hundred MHz but the clock input and
bus speed is much less. Usually 66, 75
83, or 100 MHz.

The FCC rules go down to 9 kHz. Pretty hard to get two miles range below that frequency without a *huge* transmitting antenna. There's also the LowFER band between 160 and 190 kHz, where you can run 1 watt and a 15 meter antenna. I've heard LowFER beacons more than a thousand miles away, but when the QRN is bad, even 2 miles might be a challenge. Besides, a good LowFER antenna isn't exactly portable. The best bet would be the upper end of the 510-1705 kHz "MedFER" band, where it's legal to run 100 milliwatts and a 3-meter antenna. A ground-wave range of two miles is possible with a good transmitting antenna and a sensitive receiver. CW "beeps" would be the way to go, except that it would require a receiver with a BFO. Except for the 180 degree ambiguity, the loopstick antenna in an AM transistor radio will give good direction readings, essentially unaffected by trees and terrain. However, even though I'm still an avid LowFER and also used to be a MedFER beacon operator, I'd spend the 100 bucks on a GPS. Either that or a very long roll of string.

We have a lot of deer/car accidents out where I live every year. A lot of people have taken to putting ultrasonic wind driven "whistleing" devices on thier cars. I don't know if they actually work but I know most animals can hear ultrasonics and they don't like them, tends to drive them off. This would seem to defeat the perpose of using it as a hunting beacon.

ANY power junction transistor intended for linear SSB operation up to
30 MHz will do the job nicely. Look for Ft, the transition frequency,
at which the current gain has fallen to unity at 150 MHz.

Although in your application the average power output is only 15
watts, it should be remembered that transistors are rated on
peak-volts and peak-amps and you should select a pair of transistors
rated at about 50 watts each. They are very common in this power
range. But I do not have any manufacturers' data books to refer to.

You need a pair of PA transistors as are used in the very popular 100
watt SSB HF transceivers. The transistors are usually of USA or
Japanese manufacture and should be fairly easy to obtain.

In my Icom 100-watt, DC = 14-volt, transceiver PA there are a pair of
Japanese silicon junction transistors type: 2SC2904. But I am sure
there are many alternatives.

Your low average power requirement will allow you to use a much
smaller heat sink than is used in HF transceivers.

A pair of field effect transistors, normally used as fast,
nano-second, power switches will also do the job very efficiently with
lower current and higher voltage DC power supplies. If you are
interested only in pulsed operation, not in input-output linearity,
then this may be the best direction to go. But I have no practical
experience of power-FET driving requirements.

John,

Thanks for the reply. What you say about the wider BW devices working fine at HF is quite true, but I've found that they do tend to be more expensive than the lower BW types. My first choice would be a cheap low-to-mid HF variety with no GHz oscillation tendencies, but if I have to I'll look more closely at the higher fT types.

What I've found is that they are less common than you might think! And the
manufacturers are thinning out what's left.

This is just what I was after. I know there will be Icom 100 W SSB transceivers
around for some time yet, so the 2SC2904 or similar is probably a safe bet to
design in. Many thanks!

I am trying to build an FM Transmitter that emits a continuous beeping that I can use while hunting (Using a walkman to body-block the signal and find my way back to camp when in unfamilliar woods).

I am trying to find somebody who can tell me what sort of parts and assembly will be needed.

It does not have to be fancy, or even remotely legal, since I will be using this several miles from nowhere. Just a pocket-size transmitter, that beeps, whines, warbles, or makes some other obnoxious noise and does it for a couple miles on the FM band when placed out in the open and has a battery life of 8-10 hours.

I have just barely enough proficiency with a soldering iron to avoid burning down my house, but if the parts can be bought from radio shack and thrown together on a project board, I should be able to build it.

If you can help, please E-mail me or post a reply to this.

Thank you.

Message-ID: <378ebf9f.346383122@news.aa.net>
Source record: 68512

Hello to ya'll, anyone have a tried and true design for a 10m to 75m transverter? I have a multi mode handheld transciever that would work great for the IF for a 75m tranvertor. I figured a tranverter would be better/easier then building up a multi mode homebrew rig. Also, any comments on Dans 75m SSB Centenial (sp) qrp kit? Or perhaps some hints or kinks on a 75m transverter would help. I was getting ready to start building one up myself and figured I would ask first just in case any designs are out there already.

Thanks for digging the specs out for the RG174, didn't realize it
would handle 1100 volts!!!

I wounder what ever happened to that rx-preamp with t/r swiohing I
reparied.... the RG174 was turned in to a stiff black mess looking
almost as if it had caught fire. One thing for sure it was not exposed
to 24 kW hi hi. Likely a combination of power (kW) and high SWR.

Still, I try to grab teflon cable at flea-markets as I feel much more
secure when soldering connerctors. Maybe I do something wrong but the
insulation seems to melt awfully eaisy on the 174....

Back to the issue of how to get the cable trough, I guess the simplest
way would be use a few inches of speaker cable. The jump in impedance
would problably not be big enough to be noticed!

BTW, some years ago I saw an ad from the local ham-shop, promoting
something called NINJA-Cable, a.k.a. flat coax. Especially developed
for passing thru window frames. Price was horrendous so I guess the
dropped the product!

Cheers

Hello Dave

You may wish to consider a low end GPS unit. Their accurarcy is 50-60 feet, more than adequate to find a camp site and just as small as the little HT's to carry. Also would return you to good hunting spots the second day that were located on the first day. The cost may even be less. Good luck if you still decide to build the beacon.

Regards, Hugh KF6HHS

You may want to consider one of the inexpensive "sound feeder" type fm oscillators that are used for sending sound from a portable CD player to a car radio. The slippery slope you are approaching here is that by the time you have a transmitter built up that reaches beyond the perimeter of your campsite, you would probably crossed a dozen legal (non-statutory?) boundaries imposed by the great federal spectrum father. The oscillator approach can gain extended range by adding a more efficient antenna, and raising the supply voltage to one approaching the max. for the IC that it is based around. Again, inexpensive=dirty in terms of spectral purity for the most part, and the oscillators are no exception. Ramsey offers the FM-10 fm transmitter which is based on the BA 1404 IC, if my memory serves me correctly. It will drift until it reaches a stabile operating temp, as most others do.

The end result in the discussion of this type of transmitting device is that by the time you develop something that approaches usefulness in terms of coverage area , you cross into the part of the regulation of the airwaves (Communications act of 1934; airwaves belong to the public) where you have to pay to play, In other terms, if you build a winner the FCC will gladly either rent you rights to the public's airwaves to use it or attempt to fine you out of existence after insuring that you no longer use it.

The moral, if you get it going, don't make too much noise about it, try not to use it in areas that are near population zones, consider your altitude (signal strength), and so on..... to try to eliminate the probabilities of someone waging a complaint about your "pirate station" on the FM commercial broadcast band; that spectrum has already been sold and is no longer available for use by the public that owns it.

Good Luck,

David

I worked this out once assuming $0.10/KWh. If I remember right, the flourescents lasted 9 times longer. So it came down to the cost of 9 incandescent bulbs plus the electricity to run them versus one flourescent plus the electricity to run it. Turns out the cost of the electricity dominated the cost of the incandescent bulbs (LEBs, Light Emitting Bulbs ;-)). Overall, the flourescent won by a decent margin. In a commercial setting you've also got the cost of paying someone to climb up the ladder 8 additional times.

I once did a similar project as part of a 6-meter "beacon"
transmitter for a propagation experiment. You can build it for
about $5 and it will be good for at least a mile:

I used one of the self-contained "crystal timebase" oscillators
available from every surplus store for about $1.49. They run
on 5 volts, so four nicad cells make an ideal power source. Output
is a nasty square wave, so I designed a simple LC filter to clean it
up. I fed the filtered signal directly to my antenna, which
was a 1/4-wave ground plane made from a panel-mount BNC connector.
Just solder a 1/4-wave wire to the center pin (radiating element)
and 1/4-wave radials to the four mounting holes. Tie a string to
the radiating element and hang it from a tree.

This would, of course, be only a CW transmitter, so I fed the power
to it from a 555 timer with output boosted by a PNP buffer (emitter
tied to bias rail). Set astable frequency at about 1 KHz. Yes,
this is AM but you will hear it on an FM receiver. Apparently
the oscillator frequency "chirps" when power is toggled on and
off. I could hear it just as well using FM demod as using AM. I
hung the antenna from the ceiling in my kitchen and drove my truck
over a mile before losing the signal on the scanner. My frequency
was in the 6-meter HAM band.

If you must operate in the FM broadcast band, you may have to build
a one-transistor doubler or tripler. It's harder to find the
oscillators above about 60 MHz. And you will probably be running
illegal power in that band, as the little oscillators make
surprisingly powerful RF sources.

best regards,

Martin

1287. Computer Clock Chip as Local Oscillator?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-16 00:00:00 UTC
From: lagniappe <lagniappe@my-deja.com>
Message-ID: <7mnfnegrs1@nnrp1.deja.com>
Source record: 68518

I need a stable (crystal-controlled) LO source of several hundred megahertz, capable of being finely trimmed to an exact frequency, for a block downconverter.

Noting that there are a lot of computers out there running clocks in that range, I wonder - Is the clock generator is a separate chip that I could buy and use, or is it all done on the CPU chip nowadays?

best regards,

Martin

Why not pick up an inexpensive GPS and use the waypoint feature?

Dale W4OP

1289. Re: GPS

The words "inexpensive" and "GPS" are mutually exclusive terms. I am looking to build these things for about ten bucks each. And I want to make a few of them because it would be FUN.

I have a very well built homebrew 240 volt only primary, 4800 volt 1 amp ccs secondary power xmfr. Great for that 4-1000 project that you have been wanting to get going. I no longer have a need for this much voltage. Price is $90.00 plus shipping. Warning, this thing is really heavy at around 100 pounds so shipping will not be cheap. Will only ship via UPS ground. Will be triple boxed. My zip in San Diego is 92139.

I wouldn't place computer clocks in the category of "stable".

Source record: 68523

As others have pointed out, if you succeed in getting a two mile range with an FM transmitter you are definitely illegal. But legal or not, I doubt if it would work, for a number of reasons. First of all, with an FM receiver, the loudness of the audio output is not affected much by the strength of the signal until you are near the noise threshold. Then there's the fact that your body isn't big enough to have much of a blocking effect at the wavelength (about 3 meters) of the FM signal. Add to that the multipath, reflections and blockage from trees and terrain, and it sounds like a pretty unreliable system. I suggest that you try the body-blocking approach to determine the direction of an existing FM station while in an open field, before devoting too much time and solder to this technique.

Group:

Got my trusty 3AT out of the drawer and tried to access a few repeaters
and find that tones are necessary for a bunch of them in my area.

Someone must be using a tone board with the 2/3/4AT series and can anyone
give me a suggestion for a nice, clean installation of one in my radio?

thanks. 73

Sorta depends on your definition of "inexpensive". At ten bucks, yes. But there are enough old "obsolete" models of GPS units that used units are becoming available cheaply.

1297. Frequency spurs in PLL output ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-16 00:00:00 UTC
From: emr01@ms19.hinet.net
Message-ID: <378f66f8.7652759@news.hinet.net>
Source record: 68528

I' using a down-converter IC which has an internal PLL circuit to convert the injected reference frequency at Fo to 100*Fo as the local oscillator for the first stage mixer.

Normally, when powered up, I can see a single frequency at 100 times the injected reference frequency on the spectrum analyzer on the output; and there's very small ripple voltage on the PLL loop filter capacitor. But occasionally, after powering up, I see other evenly distributed frequency spurs above and below the desired frequency. The frequency spacing between the spurs seems to vary with the capacitance of the loop filter capacitor. I find that there's 100mVpp 40+kHz square wave ripple superimposed on the DC voltage (1.9V) on the PLL loop filter capacitor. From the square wave ripple, I can imagine that it somehow modulated the VCO to produce the spurs that I saw, but I simply cannot figure out how the PLL got into such steady state (locked into multiple frequencies) in the frequency pull-in acqusition process. Can anyone kindly help me explain the phenomonen? What can I do to remove the problem? Thanks.

Oliver

Build an ultrasonic beacon and save everyone the grief. An AF
oscillator, amp, and piezo buzzer is all you need, about $3 in parts. On
receive: a microphone, amp, tone decoder, and VU meter. It's cheap,
effective, legal, and might even keep the mosquitoes out of the camp.
(Did I mention legal?)

Michael.

They would be TTL level, square waves. Even if they were stable enough,
the harmonics would kill your circuit. (I think.)

Michael.

1302. Re: ANY PLANS FOR STEREO STOMPER?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-17 00:00:00 UTC
From: "Laszlo I. Morocz" <kf4pv@spammenotlmorocz.com>
Message-ID: <01becff5$991cef20$f9f11e26@p133>
Source record: 68448

Just theoretically (since it would be illegal to actually do it, so of course I never did this) a wire antenna connected to a Heathkit RF signal generator tuned to the offending radio station's frequency would radiate enough RF that the receiver's AGC would cut in and the radio would go silent. As far as range goes, in theory, it'd work absolutely great for that person who used to live directly above me a few years back playing her music with the offensively loud beat. Not too good for her tape deck, though (or CDs today).

The best of luck to you,

Laszlo KF4PV/3

1303. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7moqlh$a3t@news.Hawaii.Edu>
Source record: 68449
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1304. help in reconnecting clipperton-L bandswitch

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-17 00:00:00 UTC
From: Tim <tvendt@kear.tds.net>
Message-ID: <01bed008$03dd40a0$539347cc@default>
Source record: 68450
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Greetings.... I am putting together, after several years of having it apart, a Clipperton-L amp. I had put some of the spare parts in an envelope with the drawing of how the bandswitch was wired to the tank (I left the wires connected to the tank itself, just unsoldered them from the switch). Well the parts were found but no drawing!! The schematic is somewhat ambiguous as to what wires go where...ie. L1 on the schematic has 2 wires coming from it but on the actual tank there are 3. It's also possible that I may have gotten the orientation of the rotary part of one or more of the wafers 180 degrees out. All this info was on that lousy scrap of paper that is gone, probably forever. If anyone has one of these amps and would be so kind as to pop the top of it and get me out of this pickle I would be very grateful.

TIA

1305. An idea for a small DDS driven TX/TNC...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-17 00:00:00 UTC
From: Paul Breed <Paul@Rasdoc.com>
Message-ID: <37900053.5A26C122@Rasdoc.com>
Source record: 68451

Analog devices has a new DDS chip....

The AD9851 that will operate as a 180Mhz DDS with a
20 Mhz external Crystal internally PLLed up to 180Mhz.
This can directly generate 2M/3 or 2M/3 signals directly.

It is small, low power and has a relativly clean output.

If you combine this chip with a SMT flash programmed micro controller
(PIC or AVR)

you could generate a MIM+TX module that would be small and self
contained.

The CPU would have to directly program the frequency deviations
necessary for
generating the modulating waveform..... So while it was transmitting it
would
be very busy..... but in the normal APRS or telemetry mode it could
spend the majority
of it's time gathering GPS data, reading A/Ds etc.... It would then form
a packet
and send it.

I am an embedded network protcol engineer by profession and I feel
comfortable with
the the development of the S/W and digital hardware but I'm I'm a babe
in the woods
when it comes to building analog RF electronics.

My first thought was to run the DDS at 110 Mhz and generate a ~34Mhz
Signal.
Due to the nature of sampled signals the DDS output will have

Fo =34Mhz (Bigger than 144Mhz signal)
Fc-F0 =76Mhz (Bigger than 144Mhz signal)
Fc+Fo =144Mhz
2Fc-Fo =186Mhz(Smaller than 144Mhz signal)

Can anyone give me some guidance on the spectral purity required in a 1
Watt transmitter?
How hard would it be to filter the output given above enough to reach
this level
of purity?

My second thought was to run the part at 180Mhz, generate a
72.5Mhz signal use the 7Pole filter in the AD9851 data sheet to filter

that, and then run the result into a a mimicircuits doubler.....
Would the result of this be easier to filter?

Could I even use the on chip fast digital comparitor to make square
waves
and use that as a tripler?

My end goal is to create a very very small no tune design.

Paul (Kl7JG)

Save yourself some trouble and get a PRYME RD-19 antenna, dual band V/UHF
and is only 19 cm long.

http://www.pryme.com/radio.shtml#ANTENNAS

Or if you don't like that one then check out the DIAMOND RH3 antenna, dual
band V/UHF and is only 4.45 cm long.

Interesting Idea Paul, but don't forget that when you multiply or
divide an fsk signal you also multiply or divide the frequency shift.
How about the dds generating at 134.3Mhz then mix 10.7Mhz to produce
the TX signal, when there is no TX data the dds will be producing the
Local Osc. frequency for recieving on a 10.7Mhz I.F. Amplifier.
Just an Idea..

I'm looking for a circuit that I can install into my homemade antenna rotator to enable an LED or LCD heading readout to about 1 to 3 degrees accuracy. I'm currently using a 10K pot in the rotator as a voltage divider to an analogue meter which works, well, just OK. I know it involves an A/D converter but I'm not well up on this stuff. I'd appreciate any help on this or better still a schematic diagram (online would be great).

Regards to all

Hansanter

1317. 2metre TX questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-17 00:00:00 UTC
From: ptay@spam-jam.interlog.com
Message-ID: <7mq645htk1@news.interlog.com>
Source record: 68463

At work, I've designed a PLL TX at 170MHz. No conversion; the VCO runs at 170MHz, phase locked through a dual-modulus prescaler and freq. synth IC. The TX puts out about +8dBm, and is FSK modulated by 78kbps Manchester data, AC coupled to the VCO varactor. Output is very clean, spectrally speaking. Not being a radio amateur, I have the following questions:

1) I can easily alter the cct to run at 2-metre frequencies. Is there any reason I couldn't apply audio to the varactor, hook up a linear amp, and have a viable 2-metre ransmitter?

2) What is the standard channel spacing in the 2-metre band?

3) What is the standard frequency offset between Tx and Rx for 2-metre work?

4) Can I get away with sharp filters and an RF relay in place of a proper diplexer? If so, at what power level would I need to use a proper diplexer to protect the Rx front end from the Tx output?

All of my experience so far involves levels of +10 dBm and below, on co-ax networks. I have no experience with off-air work, and would appreciate any help I can get.

Thanks,

Paul Taylor

Tim,

The schematic will not show the actual number of turns on the tank coil.
The simplest way would be to set the bandswitch to either 10 or 160.
The entire coil will be on 160 and the smallest amount of coil/turns
will be for 10 meters. Just line it up like that. Also you will find
that on the LOWER FREQ. bands there will probably be a capacitor or two
that is switched in/out on the low bands ONLY.

Dan/W4NTI

I would suggest the easiest thing to do is to use a digital panel meter. Feed 3.60 volts up to the pot (so that when you get to due north, you get 3.60 back down from the arm). Disable the leading zeroes and the decimal point, and there you go -- at due north, the panel meter reads 360.

That's assuming you have a panel meter whose full scale is more than 3.6 volts. Some max out at 2 volts - I suppose you could feed 0.36 volts up but I bet you'd start having noise & interference problems with that. (even 3.6 may be too low) I'd feed up something higher and then put a voltage divider right before the panel meter.

Personally, I'd leave it analog though. When working at unusual directions (for example, about 290deg. for operation here in the States) I have trouble visualizing exactly where I'm pointing from a digital display. With an analog display, I know exactly where I'm beaming.

Easy enough to trim the oscillator frequency by
using a capacitor in series or shunting the
XTAL. But if the oscillator in a 400-MHz
pentium does not run at 400 MHz, where does the
CPU get it's clock? Does it use some sort of
doubling scheme?

Don't build it!
Buy a cheap Digital Volt meter (Here they sell for less than $10!)
Set your applied voltage to the pot to exactly 3.6.
Then your 3 digit voltmeter will read in degrees!

This is the other disadvantage to buying that "obsolete" used unit. Older units multiplexed one receiver to receive six to ten different satellites; newer units, with multiple receivers, lock and hold lock better under marginal conditions like the one you suggest. My GPS II (single receiver) doesn't do well in the woods. Just one of the many, many reasons the GPS shouldn't replace map and compass, just augment them.

Call up the Analog Devices field office and ask about the new AD9854. Thy'll probably have to call the factory to find out about it though.
It has 300 Mhz clocking and built in single pin FSK w/programmable shift, frequency slewing rate, and amplitude control. Excellent spurious performance (<-80dB at 100 Mhz). Built in programmable clock generator allows use with external low frequency oscillator as low as 1/20 the desired DDS clocking frequency.
Not on the market yet...but I've worked with some Alpha samples. General availability in October.

Most computers use those ttl crystal oscillators in a can for their
clocks, which is why they aren't variable. It would be a different matter
if they used a stand-alone crystal with an oscillator, but I don't see
that happening. Looking at moterhboards, the only place I see crystals
tend to be for the time keeping clock, which is down around 32 KHz or so.

In one of the other newsgroups, the clock of these really fast CPU's came
up for some reason. Someone pointed out that they phase lock to an
external clcok source running at a sub-harmonic of the clock frequency.
So for example, if the CPU runs at 400 MHz, the external clock would be at
100MHz and the PLL muliplies by 4.

And while it has no relevance to the question of using one of those clocks in some other scheme, remember that 400MHz CPU's only run at that frequency while doing internal operations. It slows down, probably considerably, when dealing with memory or I/O or anything else connected to it externally.

Ed,

Motorola is one of the culprits I've already indicted. Their app notes for HF power amps are old, many of them specify transistors which Moto has discontinued. The reps and app engineers I've contacted don't have suggestions for replacements. I get the clear impression Motorola is phasing out their HF power discretes.

My GPS II (single receiver) doesn't do well in the woods. Just one of the many, many reasons the GPS shouldn't replace map and compass, just augment them.

Yup, the one time i borrowed a GPS (i was trying to activate CM79 [where there areno roads]), i found that i could not acquire more than one or two satellites at a time in a redwood forest on a steep slope. So there are limitations.

What about Part 15 devices? Would 49 MHz walkie-talkies give enough range? Even if you were to exceed normal power limits, in the woods, no one is likely to complain.

> 1) I can easily alter the cct to run at 2-metre frequencies. Is there any
> reason I couldn't apply audio to the varactor, hook up a linear amp, and have
> a viable 2-metre ransmitter?

I would think it would work OK. The amplifier doesn't have to be linear
for FM work. You should re-check for spurs after connecting the amp;
they can sometimes generate various spurious emissions that aren't
present in the drive signal. Oh, and be sure to get a license before
connecting an antenna<G>!

> 2) What is the standard channel spacing in the 2-metre band?

It varies. I think you're going to need 2.5kHz steps to accomodate all
the world's bandplans. If we know what country you're in (judging from
your spelling of "metre" I gather you're not in the U.S.!) and, if in
North America, what part of NA, we can give a better answer.

> 3) What is the standard frequency offset between Tx and Rx for 2-metre work?

600kHz for repeater work - to the best of my knowledge, that's a
world-wide standard. There is also some "simplex" work where the
transmitter and receiver operate on the same frequency.

> 4) Can I get away with sharp filters and an RF relay in place of a proper
> diplexer? If so, at what power level would I need to use a proper diplexer to
> protect the Rx front end from the Tx output?

Standard procedure is to simply switch the antenna between the
transmitter and receiver. (we used to use relays, but have gone to
diode switching) It isn't difficult to get enough isolation that
diplexers and sharp filters aren't necessary to protect the receiver. A
decent relay is probably the easiest way to do it.

Source record: 68479

Ladies and Gents, the antenna connector on my Magellan GPS broke yesterday, and I'm weighing the possibilities of repair. The pin in the center snapped off. Surely the company will charge me exhorbitant amounts to repair it, so it would be nice if I could fix it myself (I've quite a bit of experience with a soldering iron ... on larger curcuits). Does anyone know if the connector is commercially available? (it's very small, gold, shaped a bit like a BNC but without the lateral retention pins). It's assembled on a stiff bit of shielded wire much like coax, but quite small, and that wire in turn attaches to the circuit board inside. I'd probably have to remove and replace the connector, wire and all.

Suggestions would be most welcome. Meanwhile, I'll contact the company and see if they'll give me an estimate.

Bob, KI8AB

In order for it to be long enough range, it'd have to be in the watt
level. And the FM band is adjacent to the VOR aeronavigation band, so
if it drifts, you'll have BOTH the FAA and FCC on your case. And, (as
you posted this in a ton of different newsgroups), you're not "nowhere" as
long as, at that power level, there are small planes within several miles
of your location. So it's got to be reasonably powerful, stable, and
is going to cost you probably $50 in parts. And is against regulations.

The worst part is that 100 MHz is a lousy band for direction finding,
especially for something that you have to carry. A much higher frequency,
where you could have a decent gain yagi beam that small, or a much lower
frequency where a loop antenna would work.

>Build an ultrasonic beacon and save everyone the grief. An AF
>oscillator, amp, and piezo buzzer is all you need, about $3 in parts. On
>receive: a microphone, amp, tone decoder, and VU meter. It's cheap,
>effective, legal, and might even keep the mosquitoes out of the camp.
>(Did I mention legal?)

As I see it, a more practical method would be to get your Technician
class nocode license and build a receiver for a ham band that decoded
some DTMF codes from your handheld tranceiver that would honk your truck
horn, or trigger off a compressed air boat horn.

I was playing with a smoke detector earlier. It has a fairly large piezo
buzzer in a resonant cavity, and is quite loud. If I were to build a
homing beacon today, that smoke detector would become a parts donor.

1345. Re: Adding tone board to 3AT?

Jeff,

Check your ham mags for a company called Communications Specialist or Specialties... They specialize in a chip for adding pll tones. It's a pretty small board and takes a keen eye and low power solder iron... Might want to find someone you trust to install it and that can work with small boards. I also installed the dip switches on the back of my Icom 2AT (old thuumbwheel model) so that I can change the pl tone settings because not all repeaters use the same ones. I think the board, dip switch, and shipping was around $30 - 35... A little high but, the radio is pretty much useless without them.

Instead of asking questions on this very unreliable newsgroup, why don't you just wind one or two turns around the bead, measure its impedance or inductance on one of these simple antenna analysers, and sort it out for yourself.

Inductance and reactance are directly proportional to the square of number of turns.

Don't give up. It's quite easy really.

modern rotators cover 450 degrees or more, any suggestions for digital
display for such? I'd choose to have 270 degrees for ccw stop, and
this is also most practical with 360 degree rotators at this QTH for
VHF/UHF DX operation.

Are you joking? Pay 25$ for 0.5$ thing, especially if you incom's is about 80$ per month... It's Russia, fellow... :(Having plans I can do this antenna from realy nothing - one used BNC, piece of old coax, and 1 meter of copper gauge. I just making such monoband antennas - to 2 and 11 meters - it's very simple.

1351. Modeling a tapped inductor

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-19 00:00:00 UTC
From: Michael Young <nobody@all.org>
Message-ID: <932383579.551.16@news.remarQ.com>
Source record: 68397

In trying to understand how a published radio design works, I'm modeling the VFO section in Microsim's PSpice. How do I represent a tapped inductor? Part of the confusion comes from my not understanding what it does in the circuit, compounded by a less than clear understanding of what how a tapped winding behaves.

The toroid has 35 turns total, and tapped at 8 turns above the ground side. It looks to be part of a tank circuit at the output of the oscillator. The tank drives the gate on a JFET, and its source ties back to the tap in the inductor on the tank. (Please see http://www.redhotradio.com/Rh20_1.pdf.)

Part of my confusion is the squared relationship between turns and inductance. 35 turns on this toroid (A.L = 43) would give 5.28 uH. 27 and 8 turns gives 3.13 uH and 0.27 uH respectively. Is this modeled as two inductors in series? As a very tightly coupled transformer? Or something else altogether?

Thanks.

Michael.

Be satisfied with your current setup? I had an AH-2 on my 42'
sailboat,
tuning the backstay, and it worked great from 160-10.

I also had a rather large battery bank (2 X 880 AH) and can't imagine
putting the load of a 1kW amp on a boat system (unless you have a
REALLY large boat and a substantial generator).

I guess I'm just one of those folks who can't understand the "need"
for
a kilowatt ... I never had a problem with 100-150W on HF.

For a toroid coil where the core has permeability 10 or greater and the turns are close wound, a good approximation is to think of it as conventional transformer where the impedance ratio equals the square of the turns ratio. It's like a conventional autotransformer.

In an air core solenoid core the coefficient of coupling between the tapped portion and the full coil can be low, and a more complicated approach is needed. A good discussion of this is in Krauss, Bostian and Raab "Solid State Radio Engineering".

Greetings.... I am wondering if anyone has any words of wisdom using an HT-33a amp with modern solidstate transcievers and how you hooked it up... I have had one for several years that a friend gave to me that had a bad bias,filament,etc transformer when he gave it to me. One can be had from peter dahl for less than $100. what has your experiences been with it and is it worth keeping around and using....should I strip it and use it for parts for a more "modern" design amp? I am assuming of course that the rest of the amp is ok. High voltage is right up there and all and everything else seems to be ok, even the tube (PL-172). Any info would be appreciated.

Thanks
Tim KB1MM

Source record: 68408

The old Sardine Sender from 10/78 QST (I don't have a copy) has 5 coils in it, it used the ones that were available from Radio Shack at the time. I am looking to re-use these for another project and need to know what they were.

I just need to identify what the value of the coils were (prior to changing them for the Sardine Sender) Were there 4 of 1 value and 1 of another? This should be enough to answer my question.

Many thanks,

Tim ka8ddz

Alex OM,

I have found it very useful for ham radio homebrewing. It is a
stripped-down version of Compact Software's professional version.
There seems to be some doubt as to ARRL's continued support of this
product, but I would not let that get in the way of using it. I have
been using mine for over 3 years now.
My XYL gave it to me as a birthday present (I personally never buy
software that I cannot try out first or have guaranteed returnability
for refund; been burned too many times). I started using it, and liked
it, so in this case I would not have had Buyer's Remorse even if I had
actually purchased it myself.

From: skipp@logan.ucdavis.edu
Message-ID: <7n014g$1v7$3@mark.ucdavis.edu>
Source record: 68412

The proper way to fix your amplifiers is to install parasitic suppressors
which work, then replace the bandswitch. Otherwise you'll be back for
another bandswitch. Go to Rich Measures web page, read the information
about parasitics. It's my recomendation that you buy one of his retrofit
kits for you amplifier and install it.
Your next step would be to call Amp Supply, Jerremy Commincations or RF
Parts to purchase a new switch.

then get on with the show...

try Rich's web pages at:

http://www.vcnet.com/measures

good luck

cheers

1367. Ramsey kits... How good are they?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-19 00:00:00 UTC
From: Rick Haub <rhaub@midwestmicro-tek.com>
Message-ID: <37939C3E.D5ABE586@midwestmicro-tek.com>
Source record: 68413

I'm tring to homebrew a tube style reciever and am having some problems with it. Be that as is may, I would like to build a reciever a receiver to "get by with" until I get my homebrew on line. I was looking at the Ramsey kits for the 80 and 40 meter bands. I've read the advertisements and looked at the specs but I'm wondering just how good are they? Does any one know of anything better?

Thanks.

Hi,
If your not doing very large simulations, there is a program called
Aplac which might be better. It is free (the student version) but it is
memory limited,
although I have never run out of memory yet. The manuals are available to
download in .pdf, and the models are much more comprehensive than ARRL.
ARRL is a good program, but I think Aplac would be worth looking at first.

http://www.aplac.hut.fi/aplac/main.html

Hi Tim, I am using toroids with my 8877, stacked two for the "L" section
of the PL, and stacked two for 160 meters.
I aslo have a crude DOS program writen by a friend to calculate wire
length.
I am in SW CT, so sent me a personal for farther comunications.

Well....

I had one of the first retail copies. In fact, when I ordered, it was backordered. I did find a few bugs, although I never had my machine lock up.

Support is a problem. I originally wrote some letters to ARRL and they finally suggested that I talk to Ulrich Rohde directly. He took my phone calls with no problem. I believe that Version 1.5 is a partial result of my feedback, although when it came out, ARRL expected me to pay for the *upgrade* because I had such an old copy! (We finally got around that)

Rohde has since sold Compact (to Ansoft I believe) and now runs Synergy. Newkirk who used to support ARD at ARRL now works for Rohde at Synergy.

I bought a second copy to use on the job. Both were originally running under Win3.1 and now the office is running under WinNT and the home copy under Win98. (Note: I didn't *install* either of these, but *copied* the files over. I don't know how installing would work)

The only problem I have with running under NT is that the "tile" screen mode doesn't tile.

This is still pretty powerful software for the price, although the lack of meaningful support is the real downside. I also suspicion (but don't know) that ARRL has a license for a limited number of copies and when they're all gone, it's over.

And, Jim. Are you a software competitor? I know I've seen your byline in the trade journals, just don't remember what you were writing about.

Actually, there were 7 coils, a 100-uH (microHenry) choke and 6 10-uH coils.
The two coils used in the output were modified.

1379. Ramsey Kits - How Good are they?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-20 00:00:00 UTC
From: Jim <jdport@xoommail.com>
Message-ID: <7n1ul5$1mm@journal.concentric.net>
Source record: 68425

I've built several Ramsey kits, including 2 of their Ham transceivers.
They are not on the order of Heathkits, nor do they cost as much.
Their assembly manuals, on the other hand, are very nice for the
learning possibilities they present, and are much more useful for future
servicing and/or modification of the unit.
Having said that, I almost always have to add parts, such as small
capacitors, etc, to get the tuned circuits to resonate, and often a part or
two is missing or the wrong part. I still consider these kits to be
good values. It helps to be somewhat familiar with electronic parts
in general since the parts are often substitutes for what the manual calls
for. Having sold small kits myself, I realize the parts supply situation
and the need to stuff the kits with (at times) different parts than what
are depicted in the assembly manuals.

Not quite true.....
If one would hook up a log-amp at a suitable stage in the IF, it would
indicate the signal strenght. No need to have a Automatic Gain Control
feedback loop is there??
Just a thought.....

Cheers

I dont know if this question fits into this nesgroup subject but its worth a try....

Im trying to write a program in VB to receive audio in from the sound card line-in and save it as a .WAV file. I want this to record audio data from my radio receivers.
I know to do this i need to use the WaveIn API calls and write using the RIFF format but have no idea how to do this. I cannot use MCI as i need to read sound levels of the incoming signal.
If anyone has any help, source code in VB or VC++ id appreciate it.

Thanks

Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.homebrew,comp.lang.basic.visual.misc,rec.radio.scanner

Im trying to understand how programs such as Poc32 and MDT-Monitor use data from the sound card to decode it into the ASCII text. I know how to get data into buffers using the WaveIn API command but i dont know how to manipulate it once there to convert it into the original sent ASCII code, or in the case of Hamcom like decoders, into the 0 and 1 values used for RTTY,FEC etc modes.

I have searched the net and many books but cant find any information on how to do this. The people who wrote these programs have to learn the basics somewhere so im hoping someone can point me towards some resources with this information. My eventual aim is to write a program to decode modes such as RTTY, FEC using the sound card.

The problem being the data stored in the buffers after receiving is not the direct equivalent to the ASCII data sent by the transmitter and i want to know how to convert it.

On a side note, i notice one program comes with a VxD "Slicer.vxd" which allows windows to use the Hamcom type data slicer interfaces. Does anyone know where i can find info on this VxD which possibly means i could use it in my own programs.

Any info, URLs or references accepted

Thanks.

I have used it for several years and never had the problems you
mention. I suggest that there is something wrong with your graphics
card driver?

I have found it to be a very useful program and excellent value
compared to the professional versions.

Russell.

How does it compare in functionality and usability with the SPICE
derivatives?

Thanks.

Michael.

That's pretty harsh. It is only a linear small signal modeling program,
so it isn't much good for modeling PAs, mixers, or oscillators, but
it is useful for analyzing filters, matching networks, small signal amps,
etc. I wouldn't call RD trash, just horribly horribly limited compared
to something like Design Lab.

What you have are samples of a modulated signal. Now the fun begins:
you need to detect the signal and recover the modulation.

My two usual references on the subject are _Digital Signal Processing:
a Practical Approach_ by Ifeachor and Jervis, and _Communications
Systems_ by Haykin. I've heard good things about _Digital Signal
Processing in Communication Systems_ by Frerkin, and signed the
library's copy out to have a look at it.

This stuff is well documented, and fun!

If you look closely, I believe you'll find that while it appears to
have some
nice features, it's REALLY stripped down from the commercial version.
(obvious, considering the price delta)

For example, I don't believe that ARRL Radio Designer does non-linear
analysis.

There are several excellent *free* SPICE implementations available for
download on the web. I think for most purposes, they are quite
sufficient,
cheaper, and more capable.

Sorry I can't help with your problem - but am interested in what you're aiming at. I have an old Reveal FM Tuner in my PC which works surprisingly well with a simple ribbon aerial. The tuner output is connected to the SB (PCI) line-in, - I've wondered about recording from it (and then converting to MP3) but don't know if Windows recorder would give useful results.

Perhaps you'd keep me in mind when you do get your control up and running ?

Thanks

Eric

Hi Michael,
If the AL you reported is 43 nH/turns^2 , the inductances are:
35turns = 52.7uH
8turns = 2.7uh
The coupling factor can be estimated as a first try to be .9 .
You could roughly represent it in the Spice like a tranformer as
below:

L1 1 0 52.67uH
L2 2 0 2.75uH
K1 L1 L2 .9

Remember this is not taking into account the Rs, Rp and parasitic
capacitances.
Hope to be helpfull.

They are as different as chalk and cheese.

SPICE is a non linear time domain analysys program originally intended
for design of integrated circuits. The analysis depends on having
accurate models for all devices used. The transistor models do not
include package characteristics and these have to be added as part of
the circuit under analysis for RF and microwave circuits. This
results in a complicated network which is slow to analyse. There are
also convergence problems with some MOSFET models. Spice does however
enable distortion to be calculated. Spice works in the time domain so
it is like using an oscilloscope.

ARRL Radio Designer is a cut down version (some microwave models
omitted) of SuperCompact. SuperCompact is a linear circuit analysis
program based on the use of s-parameters and designed specifically for
RF and microwave use. It performs small signal analysis, ie., it
takes no account of distortion, but it does the analysis in the
frequency domain so it is like using a network analyser. It is fast
and has an optimiser built in so you can specify the performance you
want (eg., gain and VSWR at a number of frequencies) and let it adjust
the component values for a best fit.

Hope that helps.

P.S. I have no axe to grind - I use both.

Russell.

Source record: 68354

OK, thanks. I used a MicroSim supplied K_Linear part, and now have a good idea of what's going on. I'm still guessing at what the parameter values should be. The netlist shows: "Kn_K4 L_L1 L_L3 L_L2 {K_coupling}", where L1 is the 5.27uH primary, and L3 and L2 are the secondaries at 3.14uH and 0.275uH respectively. Does this statement correctly model two secondary windings and one primary winding?

Also, the A.L given is actually 43uH per 100 turns. The numbers I get are smaller than yours by a factor of 10. (I used a slipstick to cough up the numbers, so they probably round differently... I don't keep a calculator by the PC.)

Thanks.

Michael.

I've killed the cross-posting.

I'll try to describe the pinout for the MRF245, according to the Motorola RF Data manual.

The two end leads, where the holes, are emitter leads.

Of the other two leads, one is wider than the other. The wider one is the base, and the narrower one is the collector.

I hope that's clear.

Probably the most challenging of the charging options is charging from the car system. I really know very little about gelled-electrolyte cells, but do have quite a bit of experience with other types of sealed lead-acid batteries. The most common variety (liquid electrolyte types such as the ones made by Panasonic and Yuasa) have a maximum specification on the amount of current which can be drawn during charging. So you'd have to have a low-dropout current limiter to do the most effective job of charging. A simple series resistor would also do the job, but it might extend the charge time a great deal.

The Gates "Cyclon" sealed lead-acid batteries allow direct connection to an automobile ignition system for charging, and have no maximum current specification. The last time I checked, they came in 2.5, 5, and 25 Ah capacities. I bought an assembly of six of the 25 Ah cells at Dayton a few years ago for a very reasonable price. You can get them new from some of the mail-order battery supply houses. I've found them to be very reliable.

Of course, you could also do the automobile charging with a switching step-up supply or AC inverter and conventional supply, and a current-limited voltage regulator.

Charging any type of lead-acid cell from a solar panel will require a voltage regulator.

What I've done recently for portable operation is to size a NiCd battery for about 10 hours of typical operation, and couple it with a solar panel rated at about C/10 (1/10 the battery's one-hour current capacity). For example, for a rig that takes an average of 200 mA with a normal transmit/receive duty cycle, I use a 2 Ah battery (NiCd C cells) combined with a 200 mA solar panel. I start the operation with a fully charged battery. While I'm operating, the battery stays fully charged because the solar panel supplies the amount of power the rig requires. If I spend more time receiving or shut off the rig when the battery is fully charged, the battery isn't harmed by overcharging at a 200 mA (C/10) rate. This way, I don't need any regulator at all and can connect the solar panel directly to the battery. Of course, this system won't charge the battery significantly while you're actively operating, but it will maintain whatever charge the battery has, and won't overcharge it at a harmful rate. You can't use a lead-acid battery with this method, because it would be harmed by a C/10 overcharge.

I use the 706 in my truck, the alternator charges the battery, and I have a
solar panel
in parallel which can assist the charging when the engine is not running.
You can add a small auto battery charger in parallel too!

Sonnenschein makes sealed lead-acid cells that are compatible with
the Panasonic/Yuasa types - the same physical size and about the
same capacity for each size. But they don't require current limiting
during charging - the battery chemistry handles this "automagically".

The disadvantage is that the manufacturer specifies charging at 13.8 V,
not the 14.5 V or so put out by a typical car alternator. A hefty
silicon diode in series should drop just about the right amount of
voltage to take care of this.

Dave

> GEL cell is the way to go.

Hello, Brad,

I think Roy's advice is sound, if you read between his lines. I'll come out and say it overtly: when you have a need to run a "12 volt" radio from battery, make sure the battery is closer to 13.8 volts throughout the discharge period. Lead-acid or deep discharge marine batteries or even many sealed gel-cell (like the Yuasa mentioned by Roy) start out at 12.whatever volts and decrease from there. (At least) Two things happen when you operate a solid state rig from a < 12 V source. First, the maximum output power is adversely affected, and second, the IMD products generated in the transmitter typically increase dramatically as a result of the final being starved for voltage. The result of this is that everything may look like it's working but you'll sound horrible on-the-air.

For my emergency power/Field Day/portable source, I purchased ELEVEN NiCads. At 1.25 V/cell or so, that eleventh cell puts me at a safe voltage to keep my radio happy. (This also allows me to direct-connect my solar panel in the same manner that Roy described.) I recommend making sure that the battery you decide on gives you this flexibility.

I guess one drawback of what I just said is that the higher battery voltage will make it difficult or impossible to use the battery in your car to charge it. You're stuck with solar panel while portable, and AC (with regulator) while at home. Can you live with this?

Good luck!

R,

Al W6LX

I suspect it was more likely they couldn't be bothered. If you were a manufacturer looking for a large production run, they'd be tripping over themselves trying to find the right part for you.

> I get the clear
> impression Motorola is phasing out their HF power discretes.

While that might or might not be the case, the impression I got when contacting them for support is that I was small potatoes and wasting their time. My cousin works in the electronic engineering department at an area university, and he strikes out too!

When I was in "tech school" we quickly figured out which companies supported small fry and which ones didn't. For Motorola and SGS-Thompson, we were PNG (personna non grata). There were always Motorola data books around, but they'd been bought by the school. I remember trying to contact SGS-Thompson once for a data sheet on one of their ICs (during the pre-Internet 80s), after leaving several unacknowleged messages in voice mailboxes and writing many unanswered letters, it finally dawned on me that this wasn't going to get me anywhere. Didn't really bother me much until I heard they had bought out one of my favorites - Mostek. I knew then I was in for a difficult time.

These experiences contrasted greatly with my experiences with Texas Instuments, Analog Devices, AMD, Burr-Brown, Teltone, MX-COM, and the old Silicon Systems. They were always forthcoming with data books and

requests for literature. SSI's free K-series modem design handbook is one of the handiest books I've got when it comes to telco interfacing info. I recall writing for more info on an article in AD's Analog Dialogue magazine - got a hand-written reply in the mail from the author. Then there was the time I contacted MX-COM about their CTCSS and modem chips - ended up chatting on the phone with Dan Wrappe, the guy who runs (ran?) the company, for a half-hour on HIS dime, and he mailed some product samples to me. Reminds me of the little gifts I get from MAXIM whenever I inquire about their stuff. Never had any reason to contact Fairchild, Linear (LTC) or Nat. Semi - I was always able to find the info I needed on-hand and later on the 'Net, so I don't know what they're like. I'd been able to assemble a decent reference library from buying used data books at Hamfests, etc.

Unfortunately for Motorola and SGS-Thompson, students and hobbyists don't always remain just students and hobbyists, and when they enter professional life they take their experiences with them. I'll use their products now if an exact replacement is called for in a repair, but if it's design work I'll only turn to their product if there's nothing else available. They've both got fairly decent libraries on-line now, but I know what it's like if I need additional info.

However, not many of the companies I've mentioned deal in RF transistors (that I recall, anyway). I suggest that you think up some good search terms, and head to AltaVista, Lycos, Excite, HotBot, etc. and see what you can find. I'm sure that there are RF transistor manufacturers out there that actually want to do business, and will support a product and its development.

Here are a few old URLs I have that might be helpful - I hope they're still valid...

Ok, i know someone else out there must have a 96 Mazda 626 and must have put a mobile radio in it. Where did you mount the radio? I'm trying to find the best place for an Icom IC-2100H. The factory pocket under the radio looks promising if i can figure out how to get it out and secure the radio. Any other ideas?
thanks,
Mike

With the SimpleSwitcher switching regulators available from National Semiconductor, that is not really true. I built a 12V gel cell charger using a switching regulator to boost the alternator voltage to 16.5-17V and fed it to a Unitrode/Benchmarq UC2906 lead acid battery charger.

The whole thing fit on a 2" square pcb with plenty of room left over and properly isolates the gel cell from the car battery and the charger IC takes car of the full charging cycle, including the float charge.

Source record: 68370

I stand corrected with regard to the Yuasa. Their literature refers to a "unique suspended electrolyte", so the electrolyte might be gelled and not liquid as I had said. "Gel-cell" is a registered trademark of Globe Battery Division, and some sealed lead-acid batteries, such as the Gates and Panasonic, don't have gelled electrolyte. Gelled-electrolyte batteries are (or were -- my information is a bit out of date) made by Elpower and PowerSonic, and undoubtedly others, as well as Globe. The Exide shown on my old data sheet refers to "absorbed electrolyte", which sounds like the Gates system. Each of these technologies has its own characteristics.

Al brought up a good point regarding operating voltage. Most of these lead-acid batteries will provide about 12 to 13 volts during most of the discharge (depending on load current, temperature, and state of charge), so the radio has to be designed to operate in this voltage range. The full charge isn't extracted from the battery until you get below 11 volts, so if your rig quits at 12 your battery won't deliver its full capacity. I've gone two more steps beyond what Brad describes. My NiCd pack also has 11 cells, but is tapped at 9, 10, and 11. The solar panel goes across all 11, and the rig is connected across fewer cells when charging than when not. (NiCds can go to nearly 1.6 volts/cell when charging, and down to 1.2 during discharge.) The other thing I did was design my portable rig to operate down to 11 volts, and added an ALC circuit so the output power wouldn't go all over the map as the battery voltage changes.

A solar panel acts like a pretty decent constant current source, so if the one-hour battery capacity is about 10 or more times the solar panel output, the solar panel can be direct-connected regardless of the battery voltage. (Except, of course, that the battery voltage when charging has to be somewhat less than the panel's open-circuit voltage. The panel isn't a perfect current source, and the current does drop off as you approach its open-circuit voltage.)

While I'm talking about batteries, I'll mention a bad experience I've had recently. I bought a couple of new Panasonic lead-acid batteries. I charged and discharged them once or twice to verify that they were ok, and used them once or twice for Field Day. After Field Day, I charged them and put them into a refrigerator. One year later, the voltage was around 12 volts, well above the self-discharge minimum as it should be. However, they drew very little current when charging, and their capacity was only a small fraction of normal. Repeated cycling and other testing shows that one cell seems to have gone bad. The batteries discharge more-or-less normally, but at a voltage about 2 volts less than rated. Two batteries have done this on separate occasions, after having been

used only once or twice. The batteries are standard cyclic service types, not ones specially made for float use. I've been very pleased with Panasonic NiCd batteries over the years, but I won't buy their lead-acid batteries again. If you have any, I recommend that you cycle them before use to make sure they haven't failed.

Many 12 volt solar panels produce around 19 volts under no load. While
you can directly connect them to an SLA (sealed lead-acid) battery
(assuming the panel's maximum current rating is 1/10th or less of the
battery's capacity), you should be sure to disconnect when the battery
is fully charged. Otherwise as the charging current drops, the panel
output will continue to rise towards 19 volts and damage the battery.
The series mode charge controller does this for you automatically.

National Semiconductor has pretty good information on many of their products on their website. I looked briefly at some step-up switching regulators while I was browsing for something else. They might be suitable for what you're doing, but I didn't pay much attention at the time. The external parts count seemed pretty low, and the SMT packages will fit into a very small space. I thought at one time to build a number of small utility circuits on unetched PCB, and keep them on hand for when I need them. This would be one of the candidates for inclusion. There might even be a cottage industry for small, pre-packaged regulators, audio amps, and the like.

Michael.

I thought I was the only one who had this happen to him. On two separate occasions over the last ten years, new deep cycle marine batteries purchased for Field Day use, when charged and stored away for several months, exhibited exactly the same phenomenon as Roy described above. I thought at the time that I had ruined them out of neglect. Maybe this still has something to do with it. At any rate, the failures played a big role in my switch to big Nicads, with which I've been very happy.

I was ticked off, as you can imagine, because those batteries are expensive. Is there a right way to store lead-acid batteries over a period of up to a year?

I don't know if there is a good way to store lead-acids for long periods of time. I do know that lead-acid wet cells can last decades in float charge service. Basically this consists of keeping them on a voltage-regulated charge that just compensates for their self-discharge.

1430. DDS signal generator project

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-23 00:00:00 UTC
From: Ham <hduff@ica.net>
Message-ID: <3798DE74.55B376F@ica.net>
Source record: 68376

I'm interested in building an AF/RF signal generator using a DDS.
Does anyone know of a kit or of any previously published projects
on this subject ?
I'm looking for something that is standalone...not connected to a PC.
The only thing I've come across is the "Julieboard" from one of the Ham
magazines several years ago. It used a Harris DDS but needed to be
connected
to a PC.

My features wish list:
- 0 Hz to > 30 MHz (the higher, the better) output frequency,
- At least 10 Hz resolution,
- LCD display frequency,
- Rotary encoder with pushbutton cursor control (digit operator) for
frequency selection,
- Variable (Programmable ? :) output level in dbm or V p-p.

Anyone ?
Please reply via email, I don't check the newgroups very often.
Thanks de Hugh VA3TO

They also do not exist in the form that you are refering to. A bird tracking setup is probably the best bet, they they cost....$600 after it is all said and done.

I have pretty complete technical information, including storage and charging recommendations, for the Panasonic batteries (as well as several other brands), and there's no mention of any problem with this treatment. All manufacturers recommend that you don't allow a six-cell (12 volt) battery to self-discharge below around 10 - 10.5 volts, and most will be permanently damaged if you do. The Panasonics, in fact, are claimed to be able to recover from even this treatment. A lead-acid battery should go for a year without self-discharging below the recommended minimum voltage unless it's at an elevated temperature for a good part of the time. In a refrigerator, there should be no problem at all. And this wasn't the problem, anyway -- mine never came near the recommended minimum voltage. You could leave a trickle charge on the battery, but according to the technical data, it would shorten the battery life. (Shorten it, that is, relative to what it should be.) And a trickle charger that doesn't have a correctly temperature compensated voltage can shorten the battery life even more, and quite dramatically, according to the manufacturers. I'm not sure that leaving a trickle charger connected would prevent this failure mode anyway.

I've had some old Gates cells for over 15 years that get used very occasionally, and typically get recharged about once a year. They're not even kept in the refrigerator, and I've never had any trouble with them. Only the Panasonics have done this to me. I'm sad to hear that others have this sudden failure mode also. Wonder if it's peculiar to liquid electrolyte systems or some particular construction method.

NiCds have their own set of problems, too, but they've gotten a lot more reliable over the years. The main thing to avoid with NiCds is cell reversal. When I fully discharge a NiCd battery, I never discharge more than four cells at a time, and terminate the discharge at one volt per cell to avoid this. One of the chief advantages of lead-acid batteries

is the low self-discharge rate. In an emergency, I can get the ones out of the refrigerator and expect to have most of their capacity available. (That is, unless they pull a Panasonic and die for no reason.) You have to fiddle with NiCds a lot more frequently to be assured they'll be ready when you need them.

Source record: 68380

There's a lot of information, some good but mostly bad, floating around about NiCd care. I used to be very active with R/C cars and helicopters, which use NiCds to power the control electronics. These are nitro powered beasts, unlike the electric cars you might be more familiar with. The engine keeps on running even after the controls are gone. For obvious safety and economic reasons, battery care is a very near and dear topic.

The best advice I've seen comes from a retired battery engineer and R/C enthusiast. He has a web page with this information, but I can't find the address in my bookmarks. I'll post it later if I find it. He explains and debunks the memory myth, among other things, and puts forth very simple procedures to lengthen the useful life of NiCds. Not surprisingly, much of it has to do with charging and storage. I first came across this information about five years ago, and my flight packs are still tip-top. Commonsense says I can replace the batteries once a year more cheaply than I can replace the model ($1800 invested in the airborne package). However, I have not needed to; they still test out fine after three years of use.

To paraphrase, NiCds should be stored with a full charge, and the charge topped gently for a short period every day. For weekly cycle use, such as weekend flying or operating, charge them fully before storing, and trickle charge them for one hour every twenty four hours. My flight packs take a fast charge at 2.5C. I charge them in the car on the way home from the flying field (about 20 minutes from full discharge, usually much less). When I get home and unpack the gear, the batteries go on a 50 mA trickle charger. The trickle charger is hooked to a simple $5 household timer; it turns on for one hour every day. This minimizes crystal formation and other problems that arise when the cells are partially discharged. The short time cycle also keeps them from overcharging; shorter trickle periods might be possible if you are concerned about this.

With that said, NiCds might not be the best solution for our radios. Other solutions, NiMH and Lithium Ion come to mind, offer better power density and better discharge characteristics. Strong vibrations, typical of model helicopters, will kill them, but maybe this isn't so important in our more fragile gear. Also, NiMH cells fail open when they go, killing the entire pack. NiCds take the mechanical abuse much better, and fail closed, allowing partial voltage if and when they die.

Anyway, that's food for thought. Cellphones and ricebox HT's moved away from NiCds some years ago. NiMH or lithium ion seem to me to be better choices for backpack rigs than gel cells or NiCds.

Michael.

http://hamradio-online.com: Great Stories!

Since 1995, Ham Radio Online has become one the oldest, continuously published online "magazines" on the Internet, with feature stories from around the world - stories that you won't find anywhere else. Plus, you'll find the original killer ionospheric propagation forecasts, disaster and emergency communications resources, an online calendar of events, bulletin boards and a huge library of articles going back to 1995. HRO is now read in 108 countries.

Ham Radio Online, in spite of its professional appearance, is published as a hobby and receives no income from any source and does accept any paid advertising. Period. You are welcome to reprint our stories in your club newsletter and at your web site, per our simple reprinting guidelines asking that you give us credit as the source (details available at the web site).

Please pay us a visit and read some of current stories, such as "The Saving of Oleg" (a gripping true story), "EMF Researcher Fakes Data", The "Wanna Tinker" Construction project series, now at installment #18, and "Opinion: Marketing Amateur Radio". Plus, if you have not read it yet, check out the danger to Amateur Radio coming from home computer networks that use home telephone wiring - these horrible devices operate from 5.5 to 9.5 Mhz - right in the middle of the HF frequencies, spewing forth radio frequency interference and receiving it just as well. Unfortunately for ham radio, as of May 1999, they account for nearly 1 in 4 home computer networks now being installed.

I hope you can stop by and enjoy this web site. If you have a story to contribute, please send it along.
Thanks,
73, Ed, KF7VY

As to the cold storage - I've read through Powersonic's
manuals, and the best I can come up with is that they
shouldn't be stored in a high heat area, and shouldn't be
stored discharged. So the fridge should work OK.

But - from what I can tell, the longest storage life could
be obtained by connecting to a constant voltage source of
13.5-13.8 V (for a 12v battery, of course). This is the
recommended standby voltage, the battery will pull whatever
current it needs to maintain full charge without being
harmed at all. The voltage keeps the battery happy.

What I do:

Keep my gell's (powersonic, but I've used panasonic before)
connected to an old regulated 12v CB type 2A power supply.

Based on the literature, they should last several years this
way (powersonic claims 6-7, I've seen 5 as more realistic in
computer UPS's) Plus, the batteries are always 100%
whenever I need them.

Just random thoughts

Hi,

in the ARRL Microwave Experimenters Manual telescope brass tubing is
recommended for making cavity and interdigital filters. According to the
book this
tubing can be found in every hobby shop. I haven't seen something like this
here.
What is this tubing intended for originally? And what is it? Just tubes with
different diameter? Or really sets of telescopic tubes already slotted?

Peter

Ummm - I've held them in my hand. It's a transmitter that you
put in the rocket, and a hand-held receiver that (in theory)
has a directional antenna for leading you to your wayward rocket.
As recently as a year ago, they were depicted in the Estes
catalog. Not that such a device would help the original poster
very much. I doubt the entire concept of using one to find the
way back to camp.

> surprisingly, much of it has to do with charging and storage.

I've been reading with fascination, "The Care and Feeding of Batteries,"
on this reflector.

Although NiCads have no memory as such, many times a NiCad will begin to
lose capacity, especially when stored at lower temperatures. A chain of
gas bubbles develops between anode and cathode, effectively creating a
circuit path which circumvents a great deal of the electrolytic,
rendering the battery capacity less than optimum.

Several years ago Popular Electronics magazine had an article on
building a NiCad zapper. The circuit essentially discharges a capacitor
across the battery terminals, and blasts the bubble traces away. We
built one of these at work back then and it worked on a good number of
seemingly dead cells.

I don't have one now, but have had good luck using a Piezo "zapper" to
do the same thing to my HT batteries. The piezo zapper is the
crystal/hammer contraption found in lighters, gas grill igniters, and
"patent medicine" pain zappers. A hammer strikes the "fire crystal,"
and causes it to give up a short duration high voltage (10,000 - 30,000
V) jolt. One camping manufacturer makes an easily cannibalized unit to
ignite their gas lanterns.

Hello--
Next to a small bin filled with chunks of balsa and basswood, our
local hobby shop features a small display of structural plastic
and metal strips and assorted shapes; the brass tubing comes in
various sizes that do indeed telescope together-- the tubes are solid
brass.

You might want to do an internet search for "hobby supplies"-- that may
turn up some leads to suppliers or even the vendor of the display. The
brass tubing sells for anywhere from $.50 to $1/50 per one-foot section.

73,

Hi Peter,

Most hobby shops carry a line of the tubing mfg. by K&S out of Chicago I
believe.
Also extensive tubing carried by Small Parts, Inc in Miami FL- they have
a 1-800 #.

Chris informs me that the "transmitter" I saw was probably a
piezoelectric sounder and the "receiver" for that is an amplified
mike. Guess I didn't look closely at it, assuming it was radio-
based. I'm blushing with embarrasment. :) - Bob, KI8AB

Alan,
I think that it is very noble that you found this car and are looking
for the owner. There is a very good chance that the owner is an
amateur radio operator who is a homebrew, so don't feel bad
about posting in this newsgroup.
Typically amateur radio operators like to build gadgets, and they
have more privileges than "civilians" with radio control.
Al Rooney, N2NKB

LOL!!!! No AGC = No S-Meter = TOTAL BS!!!
In case you idiots don't know u can get relative S-Meter readings from
the audio chain. Ain't the best S-Meter in the world but it
will probably work for the radio that he's talking about and give
him some kind of relative reading. What he needs to do is look
at the HW-8 mod books copy that circuit and give that a shot.
Saying No AGC = No S-Meter is plan old dumb.

>

Hi, KC2FCR,

I've been led to believe that leaving a constant voltage on a lead-acid battery for months at a time will actually ruin the battery through a process called "sulfation". I believe this is where the useful plate area is reduced, which results in lowered capacity (A-h). So I've always been reluctant to try your technique.

It's a lousy feeling to pull out your deep cycle battery after a long time, charge it up, and go to use it only to find that everything seems okay, except that the terminal voltage is only 10 V. Like I said earlier, I finally got fed up with that and invested in 100 A-h nicads which now comprise my emergency power source. They're not the most portable battery, but today I left the solar panel on it all day and after fourteen hours of sunlight they're raring to go at a terminal voltage of 13.8 V. 100 A-h later, they will read 12.0 V on my voltmeter.

R,

Al W6LX

Hi,
One thing I know is audio output reading can be more accurate some
times.
When I work on beam antennas to set it up re: F/B ratio, gain, I plug a
VU meter into headphone jack of my RX after turning off AGC. Then using
a GDO at some distance as a reference signal, I trim or tune my antenna.
This is more dependable than AGC derived S-meter reading.

If you want to try out a "spice" type simulator then you may wish to check
out some of the low cost circuit simulation packages out there at the
following URLs:

AIM-SPICE
http://www.aimspice.com/

B2 SPICE Version 2
http://www.beigebag.com/b2spice2.htm

SPICE-IT from CAD-Migos Software Tools
http://www.beigebag.com/b2spice2.htm

CircuitMaker from Microcode Engineering
http://www.microcode.com/

Electronics Workbench from Interactive Image Technologies
http://www.interactiv.com/

TopSPICE from Penzar Development
http://www.penzar.com/topspice.htm

SpiceAge for Windows from "Those Engineers"
http://www.spiceage.com/spiceage.htm#spiceage

TINA PRO from DesignSoft Inc.
http://www.tina.com/

For a good student (limited in circuit size) check out these
URLs:

FTP site for Microcap V version 2 from Spectrum Software
Down load "demo.zip" Win95/98/NT program
http://www.spectrum-soft.com/down/

Full working evaluation version of ICAP/4 for Windows
from Intusoft
http://www.intusoft.com/demos.htm

-
Now if you want to try out some free spice circuit simulators
then check out these URLs:

FTP site with a copy of "spice3.exe"
ftp://ftp.demon.co.uk/pub/ibmpc/win95/apps/emulators

WinSpice3 for Windows (32 bit)
http://www.willingham2.freeserve.co.uk/winspice.html

Chipmunk System
http://www.pcmp.caltech.edu/chipmunk/
There are about 12 different computer systems/OS supported
including DOS/Win95 version on this site at:
http://www.pcmp.caltech.edu/chipmunk/pickup/platforms.html

For a free DOS based PCB layout program without any limits
(i.e. not a demo but was FULL DOS version) check out
Easytrax (DOS) freeware and DOS utilities on the Protel
site:
http://www.protel.com/?tab=sales&page=sales/main.htm&menu=Java

Please note that "Easytrax" is the name of the software package before
is was sold to Microcode Engineering (CircuitMaker). The package was
rewritten to run under windows and is sold as "TraxMaker" from
Microcode Engineering.

You can also check out this URL to see if you find anything of
interest. The web page has a collection of other CAD software
you may wish to try.

http://www.engr.unl.edu/ee/eeshop/cad.html

This should give you a good idea about what is out there. I myself use
the pro version of Microcap V at work, the DOS student version of
Microcap IV and the full Pro version of CircuitMaker at home.

73's,

Leland C. Scott

From: wmeara@erols.com
Message-ID: <379b6937.78804522@news.erols.com>
Source record: 68305

I noticed very poor conditions on 40 meters on Sunday morning. Those hams that I could hear all seemed to be talking about how bad conditions were. I went to some of the propagation pages on the Web, but was surprised to find them reporting normal HF prop conditions. See:

http://www.ips.gov.au/asfc/current/propobs.html

Then, around noon on Sunda7 (1600 GMT) I got on 20 CW with my HB QRP setup and worked K4IBZ in Florida (i'm in Virginia). Bill could hear my oscillator between keydowns! I measure only 15 milliwats out from the oscillator!

Can anyone explain these strange conditions?

Thanks, 73 Bill N2CQR

It probably depends on the particular battery type. All lead-acid batteries are not the same. I've looked at a couple of mfg recommendations for SLA batteries and they recommend a constant "float voltage" charge to maintain the battery. In fact, these batteries are often maintained that way for long periods of time in back up systems like a computer UPS.

1465. Class E 160m PA ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-25 00:00:00 UTC
From: Philip de Cadenet <BigMobile@g4zow.freeserve.co.uk>
Message-ID: <sDF1SMA+D2m3EwRI@g4zow.freeserve.co.uk>
Source record: 68311

Hope someone on the ng can help me.

I recently received a re-print of the Comm's quarterly article describing a 10 dollar FET class-E 700w PA for 160m.

In this article it mentions that this unit had been in use for a couple of years and that it incorporated a class-S modulator for AM!

I E-mailed one of the publishers and was told he's no nearer publishing the modulator design than they were a year ago.

I'd like to build that modulator.

Has anyone worked with this design or are there any further sources of high efficiency modulators?

Tnx

1466. need info on Ballantine 323 true rms meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-25 00:00:00 UTC
From: Rod Davis <rdavis@abac.com>
Message-ID: <379B750F.DACDE61F@abac.com>
Source record: 68312

Hi All,

I need operatin information on a Ballantine 323 True RMS meter:

Does the operating manual suggest leaving the instrument in the battery
charge
position all the time?

What battery voltage range is normal/acceptable?

Thanks in advance,

Rod KM6SN

1467. WTB: Kenwood TS-130 or Similar HF RIG

Looking for a good used Kenwood TS-130 or similar HF rig. Physical condition not all that important as long as it works well. CW fiilter would be a plus bot not necessary. Please reply via email with what you and asking price.

Actually, sulfation is what happens to a lead acid battery
that is connected to a constant voltage that is too low.
The charge process stops before the lead sulphate has been
removed from the plates. If the voltage is too high, the
water in the electrolyte breaks down, which for a gelled
battery is bad news, as it's sealed. Having the proper
voltage (13.5-13.8) is critical to keeping the battery
healthy....without a true regulated voltage source, you'd be
correct to be sceptical.

Cross-posted to: alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.scanner

I have a RS Pro-2009 8CH scanner. It has developed a problem. It will not stop scanning automatically. The squelch control will not stop the scanner from scanning no matter how low you set it. You just here all the stations while it is scanning. While it is scanning you will hear a second of audio then you have to hit the manual key to find out which station is active. It receives fine but it is very annoying having to use the manual key to stop the scanning. It doesn't sound like it anything very serious. Can anyone help me??? Thanks for your time.

This has been crossed posted on the following: alt.radio.scanner, rec.radio.amateur.equipment, rec.radio.amateur.homebrew, rec.radio.scanner. SORRY :-)

Bill

1471. 6AF11 Compactron homebrew

Newsgroup: rec.radio.amateur.homebrew

Source record: 68317

there is this compactron tube 6AF11 available at reasonable cost from AES:

1 pentode (22 mA Ip)

1 hi mu triode

1 med mu triode

any ideas about homebrew or any published designs for this tube :-

like

1. regen RX using 1 6af11
low mu = regen detector
hi mu triode + pentode as audio stages

2. superhet using 2 6af11
6af11 no 1
pentode = RF amp
low mu triode = mixer like in R390a
hi mu triode = oscillator

6af11 no 2
pentode IF amp @ 5.18 Mhz use 1n4007 gate for AGC
hi MU triode = BFO
diode balanced detector for SSB
low Mu triode as audio amp , drives headphones

Should work very well on 80m and 40m and provide atleast 120db+ gain

3. 2 6AF11 PP audio amp about 6 watts out

Message-ID: <LO%m3.416$XM5.11418@ord-read.news.verio.net>
Source record: 68321

I need recommendations for a latch circuit.

Want the input to latch to come from the drive of the audio output of a 2-meter rig (I guess any audio output would be the same)so we are talking maybe 1.5 V

I want the latch to stay on once triggered and can be reset by momentary switch to ground or something similar. I do NOT want a circuit that will contstantly latch and reset for each trigger. I imagine a simple IC would do most of it.

Lead batteries (wet, gel or solid) are voltage charged. This means that the charging voltage is held constant and the battery's voltage rises until it matches the charging voltage. As the battery's voltage approaches the charging voltage the current tapers off to near zero. A 12v lead based battery is charged to around 14.5 volts.

When the battery voltage measures 14.5 volts, the charging voltage is reduced to around 13 volts, called a "Float" value. Most good batteries will float at about 13.25 volts indefinitely, thus seeing no charge. Should the battery voltage fall below 13 volts, the 14.5 volt charge is reapplied.

Most wallwart 1 amp lead trickle chargers keep charging away, and drastically shorten the life of the lead battery. By putting a couple of series diodes in the + lead (include a shorting switch for full charge) the wallwart's output voltage can be trimmed back to provide the float charge manually.

Full charge of a lead battery is ~13.25 volts and end of charge is ~11 volts. Replace the battery when it does not keep the 13.25 volts for a couple of days off the charger.

Nicad batteries are current charged. A typical wallwart nicad charger delivers a higher voltage dropped through a fixed resistor that sets the average current throughout the charge period to around the C/10 value mentioned by W7EL. As the battery is charged, its terminal voltage rises but the current stays somewhat constant. Nicads are traditionally charged for about 16 hours at this C/10 rate. After the battery is fully charged, any further charge is converted to heat (BAD, BAD, BAD!) When a nicad battery reaches 120 degree F (not uncommon on a hot day outside), it loses 40% of its capacity, and does not recover this capacity completely after cooling.

A new nicad pack will lose its charge in ~ 1 month. To prevent overheating after reaching full charge, yet maintain the full charge level, the nicad pack should be put on a "Trickle" charge which just replaces the energy lost due to self discharge. This is commonly set to C/50, though new batteries lose less and could be set to C/200 just as well. The nicad's wallwart could have a resistor (with a shunting switch for full charge) added.

A fully charged nicad pack will measure about 1.45 volts/cell. End of life is 1.2 volts/cell. Legally dead is 1.1 volts/cell, but the amount of time during use between 1.2 volts/cell & 1.1 volts/cell or less is often measured in minutes due to the rapid down slope of the "death curve", which starts at 1.175 volts on a new battery!

As nicads age, the end of charge terminal voltage goes up, often exceeding 1.5 volts/cell, as does the initiation of the "death curve" point to about 1.225 volts/cell. The inter plate insulation inside the cell also breaks down and the battery self discharges faster, and will eventually short out if not maintained on a trickle charge.

I replace the nicad pack if the full charge voltage while on trickle charge exceeds 1.5 volts, or if the battery does not maintain >1.2 volts/cell when left to self discharge for 1 week.

Metal hydride batteries are operationally similar to nicads, except that they self discharge in 2 weeks.

For more information and diagrams, you can access my battery seminar notes that I use at the Toledo R/C show each year at

It's also possible to get charge controller IC's specifically intended
for lead-acid battery charging. For example, I have one that charges
in 3 phases: First, it charges at a maximum current (current limit
set by choosing a resistor) until the voltage rises to about 14.6 V.
Then it maintains a constant 14.6 V across the battery while the charge
current drops to some lower value, perhaps 1/4 of maximum (set by another
resistor). Then it reduces the voltage to 13.65 V (adjusted by a pot)
for indefinite float charging.

On top of this, it's specifically designed to deal with loss of input
voltage to the charger circuit while the battery is still connected:
nothing is damaged, and battery drain is limited to 50 ua. Many regulated
power supplies either blow the pass transistor (too much base-emitter
reverse voltage) or drain the battery rapidly if the AC input power fails.

Source record: 68325

> Read the agency's own press release about it at
> <http://www.undp.org/hdro/E3.html>

(1) Note that the report there does not say a penney per email, but one percent of that

"The Report suggests a "bit tax" on data sent through the Internet. A tax of one US cent on every 100 lengthy e-mails [electronic messages] would generate well over $70 billion a year."

That's $0.0001 per message -- if our messages really our our 2-cents worth, that's half of one percent :-) . Even the most prolific of us could afford this. It might mean mailing lists would have to have microcash subscription fees, or convert to newsgroup format so recipients were taxed on receipt.

This would be a global solution to SPAM though -- evastion of the email tax would be a major crime, but emailing to 6million addresses would be expensive if they didn't evade.

(2) A development agency report discussing a worthwhile but expensive goal (global minimal connectivity) suggesting a viable and reasonably painless funding mechanism to demonstrate affordability is not quite the same thing a a proposal for a tax. Connecting the rest of the world to the world wide web is wasteful? One of the better sounding proposals of out of the U.N., I'd think. Far better than digging arsenic laced wells in Bangladesh.

If you look closely, this in reallity would be a bandwidth utilization tax, much like you already have in your phone bills to help fund minimal phone service for rural folks and urban poor so 911 is everywhere.

For the sake of discussion, I will differ with you.

Any chargeable battery can be current charged, if you know the proper
current charging values to use.

I prefer to charge lead, wet nicad, or nickel-iron batteries
by traditional current charging methods that go back to the turn
of the century. Most of the time I cyclic charge, but sometimes
I float charge, all by current based methods.

Voltage charging will work, but you have to be very careful in
doing it, to put enough charge back into the battery, to replace
lost charge from use, from sulphation, and from leakage currents.
Failure to do this will slowly reduce the charge capacity of the
battery. More often than not, batteries that lose charge capacity,
in non-automotive use, are repeatedly UNDERCHARGED, in recent years.
One really needs to schedule recharge according to use patterns, and
not just a fixed voltage level, or long-term undercharging can occur.

The typical value that I use for floating charging on wet cells is C/400.

The typical value that I use for cyclic recharging is between C/10 for
12 hours to C/7 for 10 hours. That allows for a 20-30% overcharge,
under current charging parameters to allow for topping off the charge
due to heat dissipation losses. It is correct to never recharge
batteries at such current that they retain heat buildup beyond slightly
warm to the touch. If they feel hot, your recharge is at too high
a current, or if localized heating occurs, one or more individual cells
may have problems (usually dryness on ``sealed'' cells). The actual
overcharge values required can vary from 10% to 30%, depending upon
battery type, manufacturers' recommendations, practical considerations,
and charge useage patterns. It is correct to overcharge batteries
by minimally 10% on cyclic recharging, to insure full charge is taken
by the battery.

The typical value that I use for topping off recharging in standby
cyclic mode is C/10 for 3-5 hours. That is done about every 3 or 4
months to refresh the cells.

All rechargeable batteries should be cycle discharged once a year,
under expected use load, and then recharged at cyclic values.
Failure to do that will reduce the charge delivery capability of
most lead batteries. The so-called ``maintenance free'' or sealed
lead acid types are the worst of the lot in this regard.

Properly handled, charged, and used, batteries can last a long time.
For example, my banks of wet nicads are around 25-30 years old, and
still perfectly fine. They were surplus when I got them, 20 years ago,
and are in daily use. My nickel-iron cells are WWII era, and still
usable, although the wooden frames are beginning to deteriorate.
Most of my lead batteries are 10 years old or more, and still strong.
Most of my ``sealed'' lead batteries are approaching 7 years old,
and still strong.

Good Luck, and keep the batteries fresh! They are a great way to
run ham radio gear.

Well, if it's in a non-critical circuit, a 12AT7 or 12AX7 should serve.
The 12AT7's are/were rather 'prolific'.

If you are referring to what is known as self-fluxing enamelled copper wire then your previous attempts to use it may have been unsuccessful due to a relatively low soldering iron bit temperature.

You need a very hot iron, one you could almost use as a cigarette lighter. Resin cored solder is still necessary. And be quick about it.

Do not use much of it in a poorly ventilated room - the fumes are toxic.

It saves the trouble of tediously scraping the enamel off wires with a razor blade before wrapping them around soldering tags, or whatever else provides the mechanical termination.

I am under the impression most recently manufactured enamelled copper wire has this type of self-removing insulation. The wire manufacturer's or suppliers specification may give some info. Its really good stuff with a very hot iron.

For Xtal sets they have to be very high impedance such as 2000 ohms or greater. The 8 or 16-ohm things are useless. They need an amplifier and battery.

What impedance are they ? A resistance check with a multi-range DC meter is a good guide. I would be interested in a small quantity if 1.5K-ohms or more.

I don't know, either, where you can get it, but it was common where I used to work. One tip when you do find some: Use a hot iron. It strips much better with a 700 - 800 degree F tip temperature (or a solder pot) than with a cooler one.

Well, 'traditionally':

VHF is Very High Frequency and is the range 30 mcs to 300 mcs
UHF is Ultra High Frequency and is the range 300 mcs to 3,000 mcs

This was all 'established' back in the days when 300-3000 mcs seemed
"ultra impossible"
"ultra difficult"
"ultra useless"
and when music was pleasant to listen to... :-)

It seems to strip more easily if you do scrape the wire just enough to bare some copper, and also hold the wire inside a blob of solder on the end of the iron (unless you have a solder pot). Both tricks improve the heat transfer, I suppose.

Also, don't try to strip a wire while soldering it to a PCB track. If the iron is hot enough to strip the enamel, it will probably damage the track before the wire comes clean.

Thermally stripping magnet wire is a nuisance - you need a sufficiently hot iron but not so hot as to oxidize its tinning quickly. I've used an 800F temperature controlled Weller (425C) and *fine* (30 - 32 AWG / 0.20 - 0.25 mm) wire. Putting the end of the wire into a molten blob does help, as stated earlier. Wait a coupla seconds and you'll see the enamel bubbling / withdrawing from the end. Yes, it does make a stink.

That's the bad news. As I posted a week or two ago, it *does* work well, fairly quickly, and reliably. With some care in routing to prevent crosstalk, I've had both analog and digital prototypes as well as "green wired" printed circuit boards (i.e. corrected traces) work fine for decades now. Still works fine for .5mm pitch TSOPs, etc.

An alternative, which I usually use now for green wiring, is to use wire wrap style wire (green, to 'blend in' with the PCB) with the ends stripped. NoNix or similar strippers make that as fast and even more rugged. Less smelly, too.

Either way, do enjoy your project building!

Is there an FAQ or other collection of data where I might find a solution to the following problem. I am attempting to setup my laptop computer for extended battery operation. The factory (even tried a new one) battery dies after about an hours operation. .

Alternative #1 A 12 volt battery to inverter to computer. This system works until battery gets down to around 10.00 to 10.50 volts. Very inefficient and same battery as used in option #2 lasts about two and one half hours.

Alternative #2 I next tried a 12 volt lead acid gel-cell battery wired as a direct replacement for the factory battery. This battery is rated 10 amp hours. Checking voltage on this battery I find that the computer fails at 12.00 volts to 11.97 volts on my digital multi-meter. This set-up fails in about 2 hours.

The only option that I can think of at this time is to go to 18 or 24 volt battery pack and output the battery pack through a voltage regulator. However, I vaguely remember having seen a voltage doubler circuit used somewhere. Is there a posibility that a 12 volt battery feeding a voltage doubling circuit, feeding a voltage regulator be possible. Would this be more efficient than the inverter alternative? Any idea where might I find a circuit design?

Any/All suggestions appreciated,

Larry

OK, thanks Roy. I cranked the temp controlled iron to 800F, and it smokes the enamel off nicely. I haven't checked continuity yet, but the few test connections I made are mechanically sound.

I'm now wondering how to best prototype on the pad-per-hole boards. Do you normally leave component leads a bit long to allow room for wiring? Or is it more just as easy to melt the wire into the solder blob on the pad? Is there a trick to doing this?

Thanks.

Michael.

On 27 Jul 1999 10:27:04 GMT, "nova" <nova@kaunas.aiva.lt> wrote:
>What is UHF and VHF?
>nova

UHF = Ultra High Frequency
VHF = Very High Frequency
HF = High Frequency (also called SW or ShortWave)
MF = Medium Frequency (also called MW or Medium Wave)
LF = Low Frequency (also called LW or Long Wave)
VLF = Very Low Frequency
ELF = Extremely Low Frequency

UHF= 300 MHz to 3,000 MHz (wavelength =1 meter to 0.1 meter)
VHF = 30 MHz to 300 MHz. (wavelength =10m to 1m)
HF = 3 MHz to 30 MHz (wavelength =100m to 10m)
MF = 300 kHz to 3 MHz (wavelength =1 km to 100m)
LF = 30 kHz to 300 kHz (wavelength =10 km to 1 km)
VLF = 3 kHz to 300 kHz (wavelength =100 km to 10 km)
ELF = 300 Hz to 3 kHz (wavelength =1000 km to 100 km)

Notice that each band is a power of 10 different from adjacent
bands. The reason that they have 3 in them is due to the speed
of light. If you use L=300/F (L in meters and F in MHz) to get
wavelength in meters, everything comes out in straight powers
of 10.

Signal propagation is different at the different frequencies.
For the most part, VHF and UHF are line of sight, making
range relatively short on the Earth's surface, limited by the
curvature of the Earth (but range can be very long in space).

The HF, MF, and to an extent the LF frequency bands use
refraction by the ionosphere to increase their range beyond
the curve of the Earth. This is sometimes called "skip" since
there are regions where the signal "skips over" areas on the
ground as it is being refracted by the ionosphere back down
toward the Earth's surface at a distant location. Spotty global
reach is possible at these frequencies, varying with the time
of day and the sunspot number.

MF, LF, VLF, and ELF also use another propagation mechanism
called ground wave where the signal follows the air/ground
boundary around the curve of the Earth. Range for this propagtion
mechanism improves with decreasing frequency. At VLF and ELF,
it is the primary propagation mode, and gives globe spanning results.
At MF and LF, groundwave coverage is less, giving regional coverage.

HF has some groundwave qualities too, but range is relatively short for this mechanism at HF, so skywave "skip" is the dominant long range mode for the short waves. VHF and UHF have little groundwave effect, and propagation is primarily line of sight (with forward scatter and exotic propagation modes also present for those able to take advantage of them).

One such wire is or was Belden's Beldsol which uses a combination of
polyurethane and nylon as insulation. It wasn't necessary to strip the
insulation if the solder temperature could reach 750F.

Hi Larry

Many/most laptops use a 19 volt input developed from a switching wallmount adapter. The voltage at this point is not too critical since it is subsequently regulated within the laptop. ALL electronics, they have a catalog and a Web site http://www.allcorp.com/ either has or has had cigarette lighter to 19 VDC adapters. I bought mine there for $7.00 about four years ago. As I recall the voltage was slightly higher so I opened the case and reset the output to 19 volts. These things are relatively common in surplus and are made to run on "12" volt systems.

I believe it's called "Strip-Ease" (or possibly "Solder Ease") and is made by Belden among others. Used to use it to wire couplers in pipe organs - haven't used any in years, but it should still be available.

A big problem with CB amps is the harmonic output. CB amps can interfere
with airplane communications, and even in a sparsely located area you may be
5 miles from an airplane (straight up). There are way too many problems
out there, please don't be one of them :-).

1513. Re: ARRL's QRP Book?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-28 00:00:00 UTC
From: Michael Young <nobody@all.org>
Message-ID: <rpvg3t$0$37nspbj$n2p@corp.supernews.com>
Source record: 68134

OK, thanks. I am new to QRP, so am looking for the usual ARRL gloss and glowing introduction; deeper insights into design is welcome as well. However... I have a Kenwood TS-570DG that leaves something to be desired in receiver performance; among other things, the AGC pumps strongly even on signals as much as 2 kHz away. I know I can add filters, but I recently became enamored with Elecraft's K2. The numbers sound better than excellent, and the glowing praise in some circles does nothing to deter me. Anyway, I only mean to say I doubt I can design a rig as good as the big boys do, and am looking at the design side more from the "I wish I knew" angle than any real desire to brew one up from scratch.

So, I'm looking for some background on your sub-culture, and also possibly insight into the technical and operating differences and difficulties. I got my start with ARRL books, and pretty much know to expect more glad-handing than details, and wondered if there were any strong negatives about this particular new title.

Thanks for your input on the book. I would also like to hear your thoughts and insights, too.

Michael.

I'm stating the obvious, I suppose, but it sounds to me like
you need a 10-12V to 12V DC-DC convertor. You might want to
check if there is an automotive or airplane adaptor for your
laptop. If so, it might allow a lower than 12.x volt input
voltage. If not, you may be able to find a convertor module
that isn't too expensive. I think Digikey used to carry
these, but I seem to remember them as being fairly
expensive. (Like over $40)

There are a lot of little DC-DC convertor IC's out there,
but most I've seen are designed for much lower power than
your computer needs.

Thanks! They were very helpful. They said to try the sites below for the plans. They pointed out what I already knew: Its illegal to operate one of these but its not illegal to have or sell the plans. Since I sometimes ride 20 to 30 miles into the wilderness (no roads) alone, I'd like have a backup way to get in touch with someone in an emergency (I have a cell phone). Would this offend someone? These areas are already sparsely populated and you hear very little cb traffic.

http://www.panaxis.com/
http://www.cbcintl.com/TriPower.htm

I have no wish to "step on" anyone's right to the public airwaves with an amp that's too powerful - for the same reason that I don't throw my cigarette butts or candy wrappers out the window even if no one is around - I have respect for others. Yes, I strongly agree with the ban on powerful amps. I can only imagine what it would be like with no limits - there'd be a handful able to talk because they could afford the 500,000 watt mega amp. If I had an amp it would be for emergency use only. If I was in an area with cellular service I'd have no reason to use a CB and that pretty much covers every where there's people.

hmmm... true as far as it goes, but as soon as you build it, you're in
violation.

Another angle legally, is that many states have already or are about
to pass laws making it illegal to have such equipment in your vehicle
(unless your licensed by the FCC).

Source record: 68266

This type of wire used to be sold in electronic stores about 20 years ago.
The decal has long since fallen off the side of the spool of wire, so I
don't know who manufactured it. You culd also buy a little plastic dispenser

that looked like a fat pencil with a metal tube at the dispensing end. The
wire
spool was at one end, and the wire fed through the tube at the dispensing
end.
This made it fast to wrap and cut the wire.

I built quite a few prototypes with the wire. My prefered technique was
to use a small dab of hot-melt glue to hold each IC socket to blank (no
copper)
perf-board, using just a small amount of glue. Then, on the reverse side of
the
perf-board, the socket pins are long enough to easily wrap the wire around.
Wrap the wire two or three times around the pin then loop it around the
destination pin and cut. For busses, it's even faster, just loop the wire
twice
around the pin then don't cut it off, just wire to the next pin, loop twice,
and
continue on.

It takes a good deal of heat to melt the insulation, I used a 50-watt pencil
type iron.
A little bit of solder on the tip helps to transfer heat from the iron to the
joint. Then
when the insulation is hot enough, flow solder to the pin. Had very good
results with
this technique, and it was very fast.

For digital circuits, I would start with ground and power wiring. Wire the
ground in
a full mesh, and the power in a full mesh also (lots of redundant wires).
Include
the bypass capacitors in the mesh. This provided very good and clean ground
and
power.

Why don't you do a little studying and get a no code tech ham license? You can get the study guide at your local Radio Shack. That way you can run up to 1500 watts PEP LEGALLY on any ham band above 30 Mhz. If you pass a 5 wpm Morse Code test then you can run up to 200 watts PEP on the tech-plus section of the 10 meter band too. Once you have your ham license in hand I'm sure you will find many hams who would be willing to give you plans for power amps or even sell you one real cheap.

I am under the impression most recently manufactured enamelled copper wire has this type of self-removing insulation. The wire manufacturer's or suppliers specification may give some info. Its really good stuff with a very hot iron.

Yeah, recent RS wire i got seemed to do that reluctantly. And i use a fairly low temperature tip. But scraping may be the better approach.

There's no need to imagine. If you think your 75m ham band get hot try
listening in on Ch 6 of the CB.

You need 10kw to talk across the street!

I think a fella by the name of Bluegill up there in Chicago is the
undisputed world champion mobile amp builder.

I looked under the hood and in the back of his suburban at a recent CB
shoot out.

He can peak around 75kw on a broadcast size bird watt meter in the cab
though as their amp's run in class C on AM I imagine that 90% of that
power is made up of harmonics.

I agree that the takeover of Pacifica by Mary Frances Berry and the other Clintonites is a major problem. Pacifica is the only non-corporate broadcast network left (except for microradio/pirate stations, of course). The "mainstreaming" of Pacifica content to please a more "desirable" market is squashing the last outlet for progressive/left/radical programming , as well as more "quirky" or "free-form" radio originating from the local community. Hopefully the communities affected will band together to fight the national board's power grab before the stations are either sold to corporate interests (a possibility for KPFA and WBAI), or otherwise reduced to "liberal corporate" NPR/PBS clones. There is a demonstration at 5:30 every Friday afternoon outside of the new WBAI studios (120 Wall St, NYC), in support of the locked-out KPFA staff. Demand the return of RF power to the people!

I think it is good as an introduction to QRP. It also serves as a fairly complete "buyer's guide", describing a large number of commercial QRP radios and kits. If you are looking for design information, the ARRL's "QRP Power" would be a good choice.

Hello All,

I would like to know if someone has or knows where i can get the schematics for a simple beacon that I can build myself. I have all sorts of components from TV's, VCR's, and other random electronic devices. It doesn't matter what frequency that it transmitts on, but I need a range as far as i can get, preferibly over 500 ft. I would like a pulsating tone, if not a constant tone will be fine. Any info would be appreciated.

email: kf6mwa@jps.net

Greetings... I have a problem with my Kenwood TM-741 that is this.... when I turn it on, the display comes up with the word "ON" on it and then does nothing else....it just stays there. I can't turn unit off unless I unplug unit from P/S, hold down Function and MHZ and plug back in. When I do this, the full display comes up (all icons lit) and then I can shut it off. If I don't do this, I can unplug it, and then plug it in and it comes back up to the "ON" without my even hitting the on button. It did this back a few months ago but then stopped mysteriously and worked normally. Then last weekend it gagged on me again. I'm hoping someone else has had this problem and can remember what either they or Kenwood did to remedy this. TIA

I think that the intent in "mainstreaming" the program content is to attract corporate underwriters and more funding from the Corporation for Public Broadcasting. Of course, such funding comes with strings attached. When Exxon, GE, and ADM start underwriting the Pacifica Network News, will we be hearing the same quality of muck-raking, rabble-rousing, no-holds-barred investigative journalism? I doubt it! When the government controls the pursestrings (through NEA/CPB grants), will Pacifica be as likely to air criticism of administration policies? Take a wild guess.....

From 8 dual stator 400A locomotive generators all running via a
serpentine belt. I took photo's.

The big one from: www.electrodyne.com

They run big peak power numbers and only keydown for 10 seconds, just
like the drag cars at the strip. Also as I stated previously, they run
these things in class C so DC input to RF output efficiency is fairly
high numbers.
>- must have been a
>really big battery :>)
They do have battery banks to cushion the voltage drop I believe but the
latest trick is a bank of big capacitors to store the charge.

Peter Dahl supplies the 3-phase step-up transformers as they run strait
off the AC output on the alternators.

> ? I wonder if he could remember his name after a
>few key-downs...
I have suggested that he will go bald and become sterile imminently.
>73 de W6DKN
:-)

I don't condone all this, I'm licensed with a full ticket, I can't, but
I do admire the technical spunk. I feel there are few hams that given
all the money in the world could not pin even a 10kw bird slug hard over
- they'd just go to Ted Henry and ask him to build'em one instead!

One or two of the tube amplifiers were works of art, a brace of
3CX3000A7's, Jennings vac variables, the whole nine yards.

I just had to fly into Detroit to see all this. Even got a trophy for
longest distance travelled. Puts my homebrew 1200w mobile to shame.

My solution to similar problem:

Take apart radio.
Unsolder one end of lithium battery.
Turn on w/ 12v, which resets CPU.
Turn off.
Resolder lithium battery.

My problem was caused by having radio on in car, and starting
engine. Musta got a spike & corrupted rig CMOS. Now, I turn off the
radio before starting engine. Previous vehicle I had no problem
for years starting with rig on.

one 555 chip or the 2 transistor square wave generator
followed by a complementary PNP-NPN buffer circuit followed by the
2-diode 2-cap charge pump voltage doubler using 6 amp switching diodes
as used in computer SMPS and panasonic HFS 1000 UF 35 V LOW ESR caps shoudl
give you

around (Vin + Vin -2) volts

and the laptops are usually designed to work around 18 -2 0 volts anyway.

Since this is the homebrew ng, I would suggest looking at the switching regulators from Nat Semi, Linear Tech, Motorola etc. You can build a high power "boost" regulator from off-the shelf parts - the problem, however, is that you can't get more energy out than you put in. If the pack can't deliver the "horsepower" you just need a huskier battery.

Both Nat Semi and Motorola's websites have ample theory and practice on switching regulators.

I have various plate transformers, diodes, tubes, chassis', signal genrators, a freq counter, etc....

Lots of stuff from one time small repair shop. If interested, drop me a line and we can work out a deal. Will trade!

OK, so no corporate funding, no CPB, no NEA. So just where are the $$$
needed to fund the operation supposed to come from?

Stephen

Bob Weiss (bweiss@carroll.com) wrote:

Didn't get all the past posts,,, but if you're having battery life problems, maby your dc to ac inverter is not one of the newer hi efficiency units? Also,,, using gel cells, you may want to consider a 7 cell battery for extended use. While on the charger (which you will have to up the voltage a bit) it will be a bit hot at 16vdc or so,,, but off the charger and under use it will hold above 12 for much longer and allow you to use more of the charge capacity of the battery. Seems like the full size glider guys use them. Most of the electronic stuff for 12 volts is really built for a 6 cell battery under charge (14+vdc) and shut down befor using about 1/2 the capacity of the battery is used (like over 11 volts which I think you already found out)

The hot setup, of course, is a switcher with boost capacity,,, very hi efficiency and so on. Get every last drop of power out of the battery befor quitting. (don't be deep cycling an auto battery on a regular basis!)

1558. Re: ARRL's QRP Book?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-29 00:00:00 UTC
From: Don W6JL <W6JL@ixpres.com>
Message-ID: <37A0A8D0.5345@ixpres.com>
Source record: 68154

Hi Michael OM,
ARRL's specialty books are tending toward "how to buy", instead of 'how to build', unfortunately. I have found that the older the book, the more technical meat is in it (ever see any 1920's and 1930's QSTs? how far we have come..). Doug DeMaw's QRP Notebook is useful, but even moreso is ARRL's Solid State Design For the Radio Amateur (much older, of course). All of the RSGB's books have more technical content than ARRL's, particularly the RSGB Handbook as compared with ARRL.
I have used the K2 transceiver. A very nicely designed and packaged rig. But a very high $$ per watt! For a fraction of that cost, you can buy an older 100W all-band all mode HF transceiver, and if you must run QRP, just turn the power (carrier insertion) down as low as you like. Then if QSB threatens the QSO, you have some recourse (QRO). If the receiver does not suit you, then modify it as you like, build some of it outboard, or build a separate receiver.
As for receivers, most of the amateur factory-made rigs with multiple-conversion superhet designs will have some spurs, phase noise, or dynamic range limitations. There are tradeoffs for all band coverage too. The question is, what is important to YOUR kind of operating? A homebrew direct conversion phasing receiver (like Rick Campbell's R2) can have excellent performance, exceeding that of many factory transceivers, at a tiny fraction of the cost. This is the route I have taken; it is the Fun Road, HI.
Watch out for "glowing praise" on new rigs. Value means different things to different people. Some want to justify their recent buying decision, so watch out for post-purchase praise unless you know the praisor well. Consider the source of information. Is it a magazine that accepts advertising from the manufacturer?
Hope I haven't insulted your intelligence by stating the obvious, but these are the considerations that come to my mind when I think about making changes to my station. Sometimes the answer is: don't change anything (yet).

73,
Don, W6JL

How about using a multivibrator to chop the DC, feed the resultant AC into a voltage doubler(can be made from an ordinary bridge rectifier) and use this to drive an adjustable regulator such as an LM317.
see dc-dc convertors at http://hem2.passagen.se/sm0vpo for a practical circuit of a 12 to 24v convertor.

Best wishes from John.

I agree with you there, Philip -- it is sad that both the quality and quantity of technical discussions on rec.radio.cb generally exceed what you find on the ham groups.

Anyone who can manage tens of KW of RF power in a homebrew mobile installation is worthy of a hell of a lot of respect, even if he is being an illegal, inconsiderate bozo by doing so. Come the revolution, I would want to be on his good side! :)

There was a time when there were regular articles about high power mobile operation. People would put a lot of effort into modifying their cars to handle to needed current, and there'd be a lot about suitable antennas (and sometimes some rather odd-looking mobile antennas).

And I've seen in forty year old magazines articles by about designs by Jo Emmet or Jo Jennings (the memory is garbled) describing high power amplifiers designed for mobile operation. I can picture one that ran in CQ that was really nice and small, and fed the whip directly.

Such articles stand out because they were addressing the problems of mobile use, rather than trying to figure out how to put that kilowatt amp from home in the car.

My opinion on the whole mess is that Pacifica sold its soul to those it hates and took on a more "marketable" homogenized programming schedule then rammed it down the throats of the local stations. KPFT in Houston has the honor of being literally blown off the air in the 70s. It was a great station until Pacifica MADE them change their
programming to fit a mold. Well, F'em all. I remember when Ray was the station manager and their were volunteer
programmers like "Bishop Huey" who were so off the wall that you never knew what was going to hit you next. All
in all a very entertaining and informative station. Great local music. Now its TALK TALK TALK!!! About what? Socially responsible crap. Attempting to load you down with a guilt trip just like a bunch of religious zealots. Who cares!!!!
Pacifica centralized control and became NAZIS, just like all socialists eventually do.

Long live Free form Radio, perhaps the microbroadcasters will fill the gap.

Ken

I remember in a 1957 CQ that a Ham had 4-48V aircraft generators under the hood,. Then in the trunk, he had a bank of aircraft Dynamotors to feed a bank of tubes, thru the tuner circut, to a whip.... Talk about "Ham Ingenuity".... All that for a KW...

I just have a bank of 16 SRF 2062's or a bank of 8 2SC 2879's.... Does good for me.

John-I'm sure that you are not reading the same RRCB newsgroup that I have been following. While the sheer number of posts (and posters) beats the whey out of the homebrew NG, the stupid answers to even simple technical questions is enough to lower the IQ scores of unborn children!!! There are a few licensed amateurs on the NG, but some of them don't have clue, either. I have tried to recruit CBers into the amateur ranks, but once exposed to the useless jargon and red-neck mentality of typical CBers, few want to put in the work needed to get a license. Whether amateur radio survives, or CB for that matter, I will continue homebrewing gear and antennas,within the law, and with regard for my neighbors.

To be truthful I am mostly relying on specific search results I've seen
on DejaNews. I have often seen fragments of threads on RRCB that
answered questions that weren't being asked, much less discussed, on the
ham newsgroups.

I'm sure thread deterioration, personal flamewars, and other societal
failures occur regularly on the CB newsgroup. But have you surfed
rec.radio.amateur.misc lately?

> There are

Are you sure you didn't mean to say "...mentality of typical amateurs"
in your last sentence? Because if we're to judge members of both groups
by the behavior exhibited on their respective general newsgroups, I
don't think it makes much difference. :-(

I got a really good deal on some magnet wire that I am using for
radials, but the insulation is not the solder-eze type. What I
do for stripping it is burn the end with a cigarette lighter. Then
the now blackened insulation comes right off with 240 sandpaper.

I'm looking for suggestions on how I can increase the output
power of this little AM transmitter without too much work. One
suggestion would be to increase the B+ voltage, another was to reduce
the resistance of R3. I have searched the Internet and have not found
the information needed to achieve my goal. I have seen other Harley
oscillators comparable to this one that put out 5 watts. I would think
I could get 5 watts or a little less out of this circuit. I have also
not found tube data for the 12SA7 tube used in this circuit so I don't
know where my limits are.
The circuit works good and produces a nice clean signal.
Immediately after removing AC power from the circuit, the transmitter
increases in modulation greatly for about 10 seconds. Could this be
some kind of limiting on the input?
Please see the attached schematic for more info. I would
appreciate any help in this matter.

An off the shelf PWM boost converter/regulator is cheaper and requires less tinkering. Because switching frequency can be pretty high the filtering cap can be lower in value. The supply is regulated via feedback, not something that will be accomplished by just running a 555. All the parts are readily available from Digikey.

>CQ that was really nice and small, and fed the whip directly.

You must be going back to circa 1959/1960. This was, at the time the
Rolls Royce, or should I say Caddilac of mobile amp's?

I have one of those amp's. It's called a Yuba 1kw. It's liquid cooled
with a 4CX300A in the output. Has a beauty of a miniature Jennings vac
variable capacitor in the final tuning.

The HT is generated via a seriously early design of solid state inverter
running approximately 2kv out.

Coverage is 6-60MHz. One's 102" whip screws in the top.

I imagine the reason it could not tune down on the low bands was not
just the lack of plug-in tank coils but the potential corona problems!

This is my current problem on 160m at the UK full legal 400w, even with
a big capacity hat to help calm things down.
>Such articles stand out because they were addressing the problems of
>mobile use, rather than trying to figure out how to put that kilowatt amp
>from home in the car.
Quite right to. I've spent more time and money installing a state of the
art /M PSU than I did building Lee Martin's 1200w Skywalker amp kit.

Ed,
>I remember in a 1957 CQ that a Ham had 4-48V aircraft generators under the
>hood,. Then in the trunk, he had a bank of aircraft Dynamotors to feed a bank
>of tubes, thru the tuner circut, to a whip.... Talk about "Ham Ingenuity"....
>All that for a KW...
>
>I just have a bank of 16 SRF 2062's or a bank of 8 2SC 2879's.... Does good for
>me.
How do the SRF's compare with those Toshiba's which are, AFAIK the
highest output, 30MHz, 12V device currently available?

What do you use for output filtering?

I have several brand new and boxed Metron's that have never seen the
light of day that I'd like to convert to 2879's and add the then needed
fan hood.

Regarding generators.

There's a fella on one of the Hawaian islands that carries a submarine
generator in the back of his truck to power his step up transformers,
and this is 1999, ouch!

Personally, I think the way to go in future, should one wish to build
themselves a nice amp for the mobile, would be to consider going the 48V
FET route in class E and go to:

http://www.electrodyne.com

for your 48V alternator.

Hi Homebrewers

Need a few (1 ore more) compactron sockets (12-pin)
for experimenting with some 6C10 and 6Q11 I've got.
Chassis mount types would be great, PCB ones are ok.
Eventually will trade with European tubes
(NOS and tested used ones, Telefunken, Siemens, Valvo,
RFT, Tesla, Tungsram, Brimar, Russians).

Thanks for looking-up.

Franz

Regulated supply is not needed here, and 555 + transistors will be more fun
plus being more scalable(client-server terms) and reliable.

Agree with you regarding cap size, but 1000Uf/35V caps generally have a
higher surge current rating and lower ESR.

Great - incremental one-worldism reaching into your and my pocket!!! Just what we need: to be told what to do by a bunch of third world wonders and Eurotechnocrats in Brussels or Oxford who oversee a pan-European recession that has lasted the past ten years. These are the same folks who figured that the French could solve their unemployment problem by cutting the workweek from 40 to 35 hours while keeping wages the same.

Take a look at your phone bill - what are the taxes relative to the telco charges? If you're happy with that, examine your gas, electric and water bills! What percent of the "at the pump" cost for gassing up goes away in taxes? Should we discuss the fact that federal receipts are at the highest percentage of GDP since WW-II?

If you want to pay the tax, fine, go ahead and pay it. I say give the money back to the folks who earned it!

Message-ID: <37A26D6E.28@nbnet.nb.ca>
Source record: 68187

Howdy Ty....first of all NEAT lil schematic...I'm assuming its broadcast band (??). I'm no engineer, just a tinkerin fool but from a copy of GE Essential Characteristics, the 12SA7 was mainly meant to be a low power tube (pentagrid converter main use). There was 2 versions (according to this manual) the 12SA7 in a metal enclosure (mostly this is the one I've seen) which has a rated maximum plate voltage of 250 vdc at 3.5 mA....not even a watt input power. The glass envelope version 12SA7GT was (if I read the chart correctly) only rated at 100 vdc plate at 3.3 mA or 1/3 watt....So if you are on the slim side of all of this (glass tube using the low B+) yessss it is possible to get a little more power out....the plate resistance Rp is high for both versions though 1meg for the metal envelope and 500k for the glass. The main thrust of all of this though is what you're trying to accomplish......remember that a change of power output of 2 or 3db is a barely perceptible change at the receive end....I'd concentrate on your antenna....if it is indeed a BCST band rig then it'll be hopelessly short typically....lengthening will always help. Having said that be careful heheh....I was "steered" into ham radio as a youngster for transmitting about 4 miles on a 2 transistor AM rig....bit of an antenna etc heheh.

Keep on Tinkering!!

Gord Skiffington VE1AJF

From the same place Pacifica has found their support for over 30 years: from foundations, local progressive business people, and from individual listeners' contributions. This is still possoible to do in Pacifica's markets, especially in New York, where their signal reaches close to 30 million. It amazes me that KPFA and WBAI have stayed on the air as long as they have with the consistently high quality of programming they air (with the exception of a few off-beat shows, like those two fools who sat at the mic at WBAI in the late 70's, just swearing and speaking with as foul a mouth as they could devise, and nothing else; testing the limits, I suppose, and maybe some value in that, but hard to listen too).

WBAI in particular has been instrumental in changing the prudish laws that have or had restricted content, language, and certain points of view. You didn't see ABC out there risking their FCC licenses for free expression over the air, now did you, though ABC more than others have benefitted from those battles, and that network likes to portray itself as being in the vanguard. Shows like "NYPD Blue" would never have aired in our lifetimes without people like those behind Pacifica standing up to real, governmental censorship.

I grew up on WBAI, and indirectly that station led me first to SWL and later to become a ham, as it was (and is) the only FM or AM broadcast station I heard back then that spoke a different truth than the mass-produced consent-machines of the networks. WBAI led me to realize the power of *radio* in particular as a medium of thought and social change. That remains my belief, i.e. that radio is ultimately more valuable and powerful than TV in getting the word out. To the extent that people listen to news and analysis on radio, it induces serious thought and engenders action much more than TV does. Everything on TV more or less seems like a fait accompli. Let us all keep an eye on this situation, and do whatever we still can to ensure Pacifica doesn't fall in line as another NPR/CPB clone. Is there anyone organizing a national opposition to this?

P.S. isn't there a *third* Pacifica station in the Austin or San Antonio, Texas area?

1600. 10.7 MHz Narrowband IF

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-07-31 00:00:00 UTC
From: Dave VanHorn <dvanhorn@cedar.net>
Message-ID: <pZDo3.33326$8D2.5572@news.rdc1.il.home.com>
Source record: 68196

Anyone have reccomendations for a narrowband FM demod (chip or discrete) at 10.7 MHz? I'm adding this to the back of an IC-R8500 so that I can listen in any mode, and still recover doppler output, which can only be done in narrow FM.

If possible, I'd like to be able to set the bandwidth smaller, since in the HF bands, the doppler signal will be a very small component. (due to physically small antenna array)

The goal here is to enable doppler DF on as wide a band of frequencies as possible.

(I'm also looking for a decent mobile mount for the 8500, hanging that thing from the dash is NOT an option)

Good day,

There has been a great deal of discussion on the AMSAT BB regarding putting together a small, transportable mode J (2 meter up, 70 cm down) satellite SSB rig.

There were comments made that at one time there were 2 meter SSB HTs made and used here in the states. I would like to hear from anybody with knowledge, or who might possess such a beast.

Also, are there any plans for a 5 - 10 watt 2 meter, 12V (or less) SSB transmitter floating around out there in anybody's notebook?

BTW, switchable sideband would be needed, as mode requires a LSB uplink.

I have the downlink taken care of with an ARR 70 cm preamp, and an AR-8000 all mode scanner. The hard part seems to be finding a small/reasonable uplink IF.

Thanks for your indulgence, and I would appreciate any and all comments.

Based on my searching over the years, this is the status of 2M SSB
hand-helds:

1. Santec/Belcom LS-202 - 1 watt, synthesized with VXO adjust between
5 kHz steps. Does USB/LSB and FM. Was imported to US. Out of production
in Japan They're popular on the west coast as IF for 10 GHz rigs.

2. Mizuho MX-2 - 1/4 watt, crystal controlled (two 50 kHz ranges).
Was imported to US as a knock-down (PC-assembled) kit. Out of
production in Japan. Does USB and CW. Frequency setting accuracy
is mediocre because the dial readout is half-turn for 50 kHz.
Runs off a 9V transistor radio battery or external 9V. Companion
amplifier PL-2 brings power up to 3-4 watts.

3. Mizuho MX-2F - 1 watt, does FM and USB (and maybe CW); very
few made, never imported, not in production now.

4. Nishi Musen NTS-200 - 1 watt, crystal controlled (two 50 kHz
ranges). Never imported to US. Still in production and could be
imported singly. Does USB only. Crystal is soldered in; possible
but a bit painful to change (stock it covers 144.150-144.250).
Runs off six AA cells (Alkaline only, due to six not 7 cells)
or external 9V.

All of these are from Japan, but are the only true hand-helds
I've ever heard of. The LS-202 type MIGHT work for your need;
I suspect the LSB requirement would knock out the others unless
you wanted to modify the rig and install a second BFO crystal.

Unless you really want to access the satellite while walking around,
an alternative might be an ICOM IC-202S which is bigger (about cigar
box size), does 3W USB/LSB/CW, covers four 200 kHz ranges, and can
accomodate internal battery based on C-size Alkaline or Sub-C 900

mAh NiCads.

It's not an inexpensive solution, but the Yaesu FT-290R Mark II all-mode rig is relatively compact and is available with a battery pack attachment. It might meet your uplink requirements, although the power output without the linear amplifier module is only 2.5 watts. The current drain in receive is approximately 80 mA -- not quite as low as an FM handi-talkie but a lot better than any of the "big" rigs.

I use one of these with my HF rig with considerable success.

They're condensor mikes -- they require DC bias. Connect the "ring" of the 3.5mm plug to radio ground; hook the "tip" to the microphone input through a capacitor - I use 0.1uF, anything larger should work fine. (go too much lower and you'll lose low frequency response) *Also* hook the "tip" to a source of positive DC voltage through a resistor. I use a 10K-ohm resistor and a source of 8 volts, but it's not enormously critical. It's not too difficult to find capacitors and resistors small enough to stuff inside an 8-pin round microphone plug. If your rig is one of the newer ones with a RJ-45 computer LAN-type mike plug, my condolences<g>...

Source record: 68207

Most computer mikes are condenser types, Lo-Z, with
DC power required, generally +8vdc or better, and have
rather low output. One problem often ignored until encountered,
is that the shielding of this units is minimal, if at all, and result
in RF feedback problems if the radio antenna, or power output,
is close, and above a couple of watts.

A meter on the audio chain is an audio level meter. It is not an
S meter. If can perform a somewhat similar function for SSB
or CW signals, but fails dismally for AM, FM, RTTY, etc signals
where modulation output is not proportional to signal strength.

As the name implies, the holes are plated after they are drilled. This
isn't something I'd recomend attempting at home since the process
is somewhat complex and a bit dangerous. The better alternative for
home construction is to use hollow copper rivets in the holes. These
are staked in with a simple hand tool. You should solder top and bottom
to assure good electrical performance. The rivets and the installation
tool are available from some of the larger supply houses.

I looked at that rig, and the lunch pail form factor would work for a
portable Oscar station, however, people seem to hold them near and dear
and won't let go of them for much less than new prices.

I have a very nice home Oscar station, I just want to set up a portable,
roving station to activate some rare grids for other operators. Saying
this, I want to homebrew, buy surplus as much as I can.

Thanks for your response!

73, Mike

1621. FS NIB Power Transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-01 00:00:00 UTC
From: Larry Asp <larry.asp@sympatico.ca>
Message-ID: <37A46807.3334@sympatico.ca>
Source record: 68216
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchor,rec.radio.swap,rec.radio.amateur.equipment

I have 2 new in the box Hammond Power Transformers. Both are vertical mount types. The smaller is a suitable replacement for tube amateur receivers, whereas the second would be a good replacement for small ham transmitters, such as the DX20/35/40 types.

Specs as follows

Part# 271X25 115V Primary 55va Sec. 280-0-280 50ma. Rectifier Fil 5V 2A, Sec 6.3V 2A $12.00 plus postage.

Part# 273Z25 115V Primary 95va Sec 350-0-350 110 ma. 5Volts 2amp, 6.3volts 4amps. $20.00 plus postage.

1622. Needed - Key Tension Spring

Newsgroup: rec.radio.amateur.homebrew

Does anyone know a source for a morse code hand key tension spring. I have a handkey where the tension spring has weakened and should be replaced. Its a 1/2" long, and tapers with each turn.

1623. Re: Needed - Key Tension Spring

Newsgroup: rec.radio.amateur.homebrew

As last ditch effort, assuming the original spring is "expendable" :

Try heating it red hot with a torch, and then immediately immersing in a oil or salt water bath. That should anneal the steel and restore some of the strength.

Larry, this may sound silly but have you tried your local hardware store? Not the big chain stores but the smaller ones? There are several in my area that have trays of brass nuts, bolts, springs, etc. and there are several, although not exact replacements, that would fit your application nicely. I refinished an old hand key that was missing the same and used a straight spring with no taper and used epoxy to glue it to the steel base the key was mounted on.

Very good reply. I'm in a small town and both the Tru-Valu and ACE
hardware stores here have a Great Selection of such 'stuff'. Since
they want to cater to the wide spectrum of customers they have --
ranchers, boaters, homeowners, und so weiter, and the occasional weird
ham -- they have a huge set of those carboard-boxes-on-slide-out-shelves
containing selections of misc steel, brass, copper, and stainless steel
hardware. I can spend hours there -- "taking inventory" -- as I 'invent'
some new antenna or gizmo.

Several hundred years ago, before I built my current collection of
peanut butter jars filled with 'stuff', I used to take the springs
out of useless ball-point pens for projects. Tho', such a spring
as that may be too light for a CW handkey.

There may be more than one method, but one that I have seen is actually inserting a small barrel in the hole, If you find a double sided board and pull a component from it sometimes the barrel will come out too. I guess mine aren't as fancy as yours, when I one-off a double sided board I just solder both sides :)

I am considering homebrewing a simple switch mode power supply which would be used to regulate a low voltage supply of about 20v dc to provide a variable voltage supply. I have a UC3842 pulse width controller available, but would rather make something around a 555 as the pulse width modulator. I would like to hear from anyone who can suggest how I could do this in practice.

> this, I want to homebrew, buy surplus as much as I can.

A couple of things I would consider to do this lo-bux...

1. Perhaps one of those Radio Shack 10 meter rigs with a transverter.
This would be small to be portable but not especially cheap. A Downeast
Microwave transverter with 20w out is $300 in a kit and $400 assembled.
The RS 28mHz IF could cost as low as $75-100.

2. MFJ is advertising an "Adventure Radio" that does 2 meter SSB with 10W
out for $285. A CW 'attachment' is something like $40 more. I'm not sure
if it actually is available yet because my local dealer has said that he
isn't able to stock any yet.

If you are willing and able to homebrew on the circuit design level, you
might get away with a cheaper setup. I'm just getting into VHF in a
serious way and am going with the HF rig/ transverter setup. I am using a
TS520 as my IF and have just a Downeast 2 meter transverter. I'm not sure
what band I will go for next but will either go for 70cm or 23cm. If I go
with the 70cm, I might also get hooked up with a sattelite setup. The
Downeast transverters are actually quite small (7"x4"x2") and by
substituting a smaller IF (perhaps a RS 10 meter rig) it would be quite
small and portable. Lash 'em all together in some sort of rack and they
would be easy to carry. Even just using the TS520, its not too bad- the
520 can run on 12V and is a superb way to run transverters- built in
connections! A bit heavy, though.

That's about all I have to offer... Take care and hope to work you on the air.

If you can find a TV rotator that the boom will go through the rotator part, even if you have to break off a tab of metal, then you can use it for the elevation rotator. YOu just mount the rotator housing to a plate. I think the modle used was an Alliance u100. I did that for a while on a sat setup I had. You rotate the horizontal part with any standard rotator. If you want a more precise indicator, take a pot and hang a weight so that it will swing as the elevation rotator is turned. You may need to put a cover over the rotator to keep the rain out.

No, that won't *anneal* the steel, which would make it soft. That will *harden* the steel, glass hard in fact. That's the *first* step in restoring its spring. Hardening is done by bringing the steel's temperature above the Curie point (a magnet won't stick to it), then quickly quenching it. A bright cherry red glow is approximately the right temperature, though the magnet test is more foolproof.

The second step is to draw the temper back so that it isn't so brittle that it will break when flexed. That's done at a much lower temperature. You want to heat it until the polished surface turns a light straw or bronze color, about 400 to 550 degrees depending on the alloy, then plunge it into cold water to keep it from turning purple (dead soft). These latter colors are oxide colors on the metal surface. The surface has to be polished to see them. They run *quick*, so you have to be quick to plunge the part into cold water at just the right time to get the desired temper.

If you were to heat the spring until the colors run purple, then let it cool *slowly*, you'd anneal it to a dead soft condition. It wouldn't be a spring then. Of course you can harden it again and try tempering it again. There's a bit of an art to doing this at home, but blacksmiths did it for centuries before the advent of carefully controlled alloys and special hardening and tempering furnaces with electronic profile controllers.

You could also buy R2 receiver and T2 transmitter boards from Kanga;
then you would only have to homebrew the 70cm LO (Kanga has a 2M
LO kit). Then a few MMICs followed by a 10 watt amplifier and you're
all set. With a well-stocked junk box, you might be able to get on
Mode B for around $300.

1640. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7o36lugfv1@news.hawaii.edu>
Source record: 68086
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and its
content drifts further and further away from being "on-topic" in the
various NGs which receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

The easiest way I can think of is to use a 556 rather than a 555 (or two 555's). One serves as the multivibrator, the other as the modulator. You can also use the CD4069 (hex inverter) to do the same thing.

If you want to "regulate", then by definition you are going to need some form of feedback to control the duty cycle of the PWM. This is why the off the shelf chips excell. Even an inexpensive chip like the LM3524 can be pressed into service quite easily. The duty cycle for these chips is adjusted by providing a variable voltage to one of the pins. I believe that if you use a 555 to drive the switching transistor you will need a transistor "totem pole" to drive the gate. This isn't necessary with the PWM chips.

It might just be easier to use an LM317 and a transistor. If you need to get down to "0" volts you can bias the "adjust" leg of the LM317 by the negative of the amount of VRef to get to "0"

I'd rather not have this nice steak dinner, instead I'd like some stale catfood please?

Stick with the 384X series, they are excellent SMPS controllers. Easy to use as well.
The 384X series has undervoltage lockout, duty cycle limiting, current sensing, and an output that will drive up to 1A to control the mosfet gate.
The 555 can probably be made to do some of that, after a fashion.. but it's output will never be that stiff. So either your FET will run warm, or you get to add external transistors to drive it.

:-P

WRONG!

Six: WBAI - New York
WPFW - Washington
KPFT - Houston
KPFA - Berkeley
KPFB - Berkeley
KPFK - Los Angeles

KPFB was originally licensed as an off-channel translator to
fill in the shadow in Berkeley caused by the Oakland Hills
whereon the KPFA transmitter is located. With the advent of
on-channel boosters (which would not be feasible in that
configuration) they had to go "split programming" to some
extent because off-channel translators were no longer permitted
for "fill-in" purposes in the city-grade contour.

Why is this non-amateur-radio local Bay-Area topic being
posted here -- there is a very active discussion of this
circus in the ba.broadcasting n/g.

I have been there and done that,

this is how :-

555 as sawtooth generator (from the RC cap on 555)
LM 741 as PWM driving a power switching transistor
another LM741 as error amplifier (a simple transistor can be used here
instead)
Another 741 or transistor for current limiting (if you care)

This can be used to build, BUCK, BOOST and invert flyback convertors.

This works very-very well indeed .

good home brewing.

And probably add a pair of transistors to bring up the gate drive, and an additional circuit for low voltage shutdown, or just use the 8 pin 384X chips, which do it all.

All right,
here I go : -

It is indeed possible to make simple buck, or boost PWM regulator
(variable ferequency) with a minimal number of components
in the following 2 ways:-

1. the old BLOCKING OSCILATOR, just add a diode rectifier and filter
at the output, and add a zener diode fed back to the base of the
blocking oscilator transistor or darlington. This circuit was used
in numerous calculators (the early flourescent Display tube types with PMOS
calc chips) .
A scaled version of this also used very commonly as a flyback convertor
OFFLINE @ 120 or 240 volts AC/DC. They use a optocoupler and zener diode
for the feedback LOOP. This can handle upto about 100 watts.

2. 1 OPAMP as a comparator and 1 switching transistor as
pass transistor works very well as a switching regulator(variable frequency
again).

NOw , can you beat this stuff in SCALABILITY ann simplicity with 384X,
not to mention that you really need no special components, and also that
384X cant work OFFLINE anyway at 120 or 240 volts.

73s and happy homebrewing.

Be very careful if you go the OFFLINE route.

Message-ID: <4294947510281019654 5NEWS2LX@news.idea-works.net>
Source record: 68102
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.amateur.homebrew

I have the following items that I would like to sell as a package or possibly trade for some type of VHF/UHF equipment (dual band HT, mobile rig, base rig, etc.) or some type of 10 meter equipment or maybe even an older laptop:

Small Wonders Labs SW40+ 40 meter QRP CW transceiver. Has optional factory enclosure also has option Freq-Mite frequency counter. Currently set for the Novice section of 40 meters (easily changed to General & up portions of the band). Also includes a ten-turn pot that aids in tuning, but I have never gotten around to installing it as the factory pot has served me well.

NJ-QRP Club Rainbow Tuner with optional beautiful and 'bulletproof' enclosure. This is an awesome QRP tuner which tunes a longwire for 40 meter operation. It is powered by an internal battery and uses four small 'rainbow colored' LEDs to indicate SWR. You can view details of the Rainbow Tuner at http://www.njqrp.org The tuner is also easily converted to operation on other bands through a kit which I believe the NJ QRP Club is still has available. Connection to the SW40+ is made through a short piece of coax with BNC connectors on each end, which would be included. The tuner automatically turns itself on when it sense RF and run hundreds of hours on the included battery.

Depending on what is offered, either financially or in trade, I also have a Vectronics keyer that has been built into a Radio Shack plastic enclosure that conatains an internal speaker for code practice and is adjustable for about 3wpm to about 30wpm. It is powered by a 9 volt battery.

I am 99% sure that I have manuals for all the above listed items and would also provide them with the equipment.

If anyone is interested, please feel free to email me. Thanks and 73!

Jeff

At only 44 kHz, a good DSO (Digital Storage Oscilloscope) should be
able to make the measurement. Most have a "hold" mode which
accumulates
a programmable number of sweeps, which should allow you to make a
pretty accurate pkp-pk jitter measurement. From that you can
calculate
absolute RMS jitter, convert to degrees, and come up with an idea of
how
good/bad it is.

Some of the more capable DSOs even have built-in functions such as
an automatic pk-pk and/or RMS phase jitter measurements, FFTs,
etc.

hmmm... not likely, Phil. The devices you mentioned have rather high
input and output capacitances, which would certainly preclude
operation at 6 meters. Most power mosfets (of the "V" channel
variety) won't hack it as HF amplifiers. With careful selection (for
low i/o capacitances), however, you can manage to make them work up to
about 10MHz. The IRF610 is an example of one that we've seen used
this way, although not at these power levels. However, the MRF157,
mentioned by Leland, is characterized for RF service (with a pricetag
to match).

I'm not sure how accurate a measurement is wanted. The technique that Carl
mentions may or may not be sufficiently accurate due to trigger jitter and timebase
jitter and wander in the oscilloscope.

In the telecom standards literature, jitter and wander are defined differently.
Jitter are the phase noise components above 10 hz, while wander are those

(well) below 10 hz.

Traditionally, jitter is measured by phase-locking a reference oscillator to the
measured source. The reference oscillator has to have a very-low tracking
bandwidth, and good phase noise properties. This oscillator is then used

to demodulate the oscillator under test down to DC. The phase noise
on the source is thus converted to AF. To measure jitter, a single-pole
10 hz. high-pass filter is used to filter the output. A couple of techniques can
be used to measure the noise, but an FFT-based spectrum analyzer is one way.

For wander, it's more difficult, because a highly-stable reference oscillator
needs to be avaliable to be phase-compared to the oscillator under test.
Normally, a count of the phase drift over a long measurement time is
performed. Different measurement times provide sometimes strikingly
different answers!

Yes, of course you're correct. I was aware of their upper frequency
limits.

I hope you or someone reading this thread can help me with any pointers
to either of the following.

1. In May 97 QST there was published a multi-part article called 'High
Efficiency class-E Power Amplifiers', by KE6VWU, KF6GHS and KF6GHY. This
project evolved from an undergraduate student project at Caltec.
I should like to know what following month's editions of this magazine
published the remaining parts of the article?

2. In Comm's Quarterly fall 98, a similar article describing a 700w CW,
250w AM class-E PA for 160m mentions the use of a 'class-S' modulator.
I would love to try building such a modulator but all my current search
engines come up with a big ZERO this subject. Does anyone have any
references or have they done any work in this area?

Fritz Raab, W1FR one of the two publishers of this article kindly sent
me a reprint but says the publication of their modulator design is no
nearer publication now than what it was two years ago!
Shame, if you ask me.

What is a homebrewer to do?

> Remember this must be small and lightweight.

A copper tape dipole could work well, but of course it's somewhat directional. If your tail is high enough, you could do a vertical dipole, which will work well unless it's right above you.

One thing to try might be a pair of dipoles, one vert, and the other horizontal, fed with half the power each. I fly rockets, so I don't get that much of a choice. :)

Why is this non-amateur-radio local Bay-Area topic being
posted here -- there is a very active discussion of this
circus in the ba.broadcasting n/g.

Perhaps because of the low signal/noise ratio on the topic on 'ba.*' and the occasional (usually off-topic) discussion of WBFM homebrewing here. Thanks for the reference to 'ba.broadcasting' and also check 'ba.politics'. Is the microbroadcasting NPRM still open? If so, does anyone have a URL for it?

Good points ... I was also not sure how accurate a measurement was
wanted/needed. I was trying to describe a way to get an idea of the
magnitude of the jitter with a simple technique using common, standard
equipment.

Agreed that there are more accurate ways to make the measurement,
but some of the beter DSOs are capable of making jitter measurements
pretty acurately, even in some cases down to the picosecond levels.
I figured that the "quick and dirty" technique might well be accurate
enough for a 44kHz square wave (a multivibrator, I assume) oscillator.

Try a 1/2 wave dipole across the wings by putting a 1/4 wave wire on each wing fed in center. You can also use copper foil as the conductor. Remember the dipole will be a shorter length than a dipole in free space. You will need to trim for lowest swr, best signal.

In full size aircraft, we use a shallow horizontal vee dipole... It helps to fill in the dead zone off the end of a straight dipole...

Another way to make these jitter measurements is to compare
the signal to a delayed copy of the same signal. A computer
memory delay line chip might give enough delay. Should have
about 90 deg.. phase delay for max. sensitivity.

A stable Osc.. frequency locked to the signal is the normal
method as has already been pointed out.

Thanks for the info, Tom & others. I'm looking for a pretty accurate
measurement technique, as it happens. The object of my interest is the
phase noise performance of digital audio sample clock oscillators such as
are used in [pro audio] A-D and D-A convertors. The problem is that very
few of the manufacturers of professional-level digital audio equipment
actually publish the jitter specs of their gear. This is a strange state
of affairs, because clock jitter does have an impact on the quality of the
audio listened to at the end of the chain.

Thanks again,
Tony Grimwood

BTW - sorry if this thread is a bit off topic, but Amateurs came immediately to mind as just the kind of folk likely to have this level of technical knowledge. :) --... ...--

Various easy and intermediate skill mods to try on tube radios, mostly
the AC/DC kind. Using higher conversion transconductance converter tubes,
higher gain IF tubes, longer ferrite loopsticks, etc.

1692. Re: Oscillator phase noise

You might also mix you 10 KHz signal with its self a few times (multiply)to get the phase noise higher and within the measurement capabilities that you might have with a good scope. Phase noise increases 20 LOG (N). Neal

1693. DDS VFO Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-05 00:00:00 UTC
From: henryt@perth.dialix.com.au
Message-ID: <933836326.188420@newton.dialix.com.au>
Source record: 68040

Hi All,
There was a very interesting DDS (Direct Digital Sythesiser) VFO using the Analogue Devices AD9850 in July '97 QEX. (I don't have a copy of the article, I have seen some of the PIC code on the net).

I am interested in knowing what the limitations might be in using this type of VFO up to 6m frequencies? Does phase noise become a major problem? Are there other problems using it on frequencies above 30Mhz?

Best Regards From,
Henry.

: Thanks for the info, Tom & others. I'm looking for a pretty accurate
: measurement technique, as it happens. The object of my interest is the
: phase noise performance of digital audio sample clock oscillators such as
: are used in [pro audio] A-D and D-A convertors.

As far as I know the actual sample clock in these systems are always generated in a crystal oscillator or VCO running at a high multiplier of the sampling frequency e.g. 256 x 44.1 kHz = 11289.6 kHz. While the phase noise would be impossible to measure at 44.1 kHz with a spectrum analyzer, it might well be measurable at this much higher frequency, since the phase noise is spread over a much larger bandwidth.

If a spectrum analyzer, the oscillator frequency could be mixed down with a clean crystal oscillator to the audio range and using the sound card and FFT, the phase noise spectrum of the oscillator can be measured. Applying corrections for the division ratio will give the phase noise at 44 kHz. In this example, the oscillator frequency could be mixed with 11288.0 kHz, folding the tone to around 1600 Hz and sampling this at 8 kHz and using 8192 point FFT, the phase noise for every (about) 1 Hz can be measured, thus the phase noise spectrum for every 4 mHz (that is millihertz) of the 44.1 kHz sample clock can be calculated. The problem is then to convert the phase noise spectrum to time jitter measurement.

Of course, this method only measures the sample clock impurity due to oscillator spectral purity, but it does not measure any extra phase noise generated by the frequency division chain.

The higher the oscillator frequency, the more the phase noise spectrum spreads out, thus making it easier to read it. It might even be possible to run the oscillator frequency through a few frequency multipliers before heterodyning it down to the audio range for FFT.

I have not done any quantitative measurements using this method, but I have used it in some qualitative assessments of oscillators running in the 60-90 Mhz range multiplied up into a 1-2 GHz range and listening to it in a good quality CW receiver. While listening at the fundamental frequency of the oscillators, they all sounded very clean by the ear, but listening to a high multiple of the oscillator frequency reveals clear tone purity differences between various oscillators and also reveals other artifacts, such as very low frequency microphonics of the oscillators.

Speaking of Kenwood Mics, does ANYONE have any idea how to repair that stupid modular, punched on connector that Kenwood so brilliantly chose to use on the mic for the TM-261A and similar VHF rigs?

The silly punched on clear plastic connector looks like something on a throw-away telephone, but no, THEY used it on the $75.00 microphone!

Now of course after a few months of use, mine is falling apart.

Is there some tool to replace that punched on connector or does anyone have any tips on repairing it?

If I have to buy a $75-79 replacement mic for this $199 radio after 6 months I will say "NEVER AGAIN" to Kenmore!

The problem is to achieve a flexible mounting on a PCB to avoid
mechanical tensions on the tube base, but strong enough to keep
the tube from 'wackeln' (vibrating?). Sorry, I don't remember the
right word.

>>I myself am wondering about compactron sockets, dont want to buy one
>>compactron socket for $2.50 or so.

I don't want it too, if I can avoid it.

>Any female socket pin capable of grabbing onto #18 AWG soild wire will
do.
>You could cannalblize 7 and 9 pin tube sockets.

Thanks for reminding me.

I've done that already in the past, setting up some kind of
'surface-mount' 7-pin miniature socket of suitable female
contacts, to test a crystal oscillator design using a VHF triode.

I guess I'll try it with the 12-pin version again.

Franz

1700. Any ideas on a modulation transformer...

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-05 00:00:00 UTC
From: imahumanradiostation@my-deja.com
Message-ID: <7ocs5k$sr8$1@nnrp1.deja.com>
Source record: 68047

I'm currently developing a solid state 5 to 15 Watt AM phone transceiver for 80M SW band and was wondering if anyone had advice for a modulation transformer. It seems that the only source for modulation transformers now days are CB's but I was looking for something a little easier to obtain.

I have heard of some folks modifying existing "audio" chokes (the large ones that look like transformers) buy adding a secondary or tapping at a certain point. Has anyone tried this before?

Any help would be great, thanks.

Joe

1701. Making a 2m 5/8 from copper pipe?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-05 00:00:00 UTC
From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <7ocqe2$1i9l$1@nntprelay.berkeley.edu>
Source record: 68048
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

I have a 51-inch piece of leftover copper water pipe,
"3/4'' Type" (which actually measures 7/8'' dia).

This seems about right for a 2m 5/8 wave antenna. Has anyone
done this with this particular material? I ask that specific
question because a) I think the diameter should affect the
length; and b) I can't quite figure out how to physically mount
it with an appropriate loading coil.

thanks,

Sounds as though you'd need to use some non-digital method of multiplication,
like the old harmonic-resonant amplifier types in old VHF gear.

Those pesky plugs are the industry standard in the commercial radio business and have rarely been a problem -
If it is an RJ11 - 6 pin conductor you can buy a 6 pin crimper for about 20 -30 bucks (buy a nice one) and you can get the plastic pieces fir about 2 cents each.
You make note of the wire sequence (1-6) and cut the old one off - insert the line into the stripper into the deisgnated stripper - measures length - and strip - insert the wires into the plastic plug - crimp it and you have a new plug-

I would never want to go back to the old mic plugs - they take way too long when broken - i can recrimp a new plug in under a minute -
if they are an 8 pin plug - get an 8 pin crimper - most mics are standard at 6 pins

>
If you can accept the low power, a modulation transformer from a CB set
may be the easiest to come by. Occasionally, I do see CB sets at garage
sales (and selling for five dollars or so) and a few years ago I found two
in a neighbors garbage. I've even seen some at hamfests. And I imagine
other locations might see more CB useage, and thus more items for sale.
If you have to spend five or ten dollars ona CB set that you can get
locally, it may be cheaper and easier than tracking one down by mail.

Rick LIttlefield, in his 6 meter AM transceiver in the Winter 1998 issue
of Communications Quarterly (and a similar rig for 2 meters an issue or
two later), used a modulation transformer from a CB set. I recall Peter
Bertini asking about such transformers before the article appeared, and I
assume it was chosen because they were easier to come by than some generic
use moudlation transformer.

People have used power transformers in years gone by. I don't recall the
requirements. I do remember someone suggesting 400 cycle power
transformers, because they would be better for speech transmission and
they were cheap.

In an issue of Ham Radio from 1969 or 1970, someone suggested (based on a
commercial circuit he'd seen) modulating a regulator to modulate a
transmitter. A followup letter or two was shocked by the inefficiency,
but if you're using it at home, it is a means of using semiconductors
(which are readily available) to replace the iron (which is harder to find
these days).

>
Since you refer to 80 meters as a "SW band" rather than a ham band, I

figure I'd better mention the need to be licensed, just in case.

I have not tried this but a way to trade circuit complexity for efficiency
and iron
may be to modulate a switching regulator. the problem is that the output
filter
for the power supply will have to be rather fancy in order to pass the audio
but not have any switching components that will cause spurs.

Hi Phil.

I have that document (including the first part from the May issue)
available as a Microsoft Word 97 document, complete with all graphics,
if you have the capability to read such a document. If you're
interested, my ICQ # is 22964426 if that's an option for file
transfer. Alternatively, I could email it to you if your ISP allows
attachments. I can be reached by email at:

knox_k@nemaine,com

Hope this can be of help to you!

Ken

From: Paul <pmartin@bright.net>
Message-ID: <37AB28A6.F9412CEA@bright.net>
Source record: 68065

An elmer of mine (long since a silent key) , whom I greatly respected, once told me it was no big deal to build a regen receiver that was sensitive enough to work with a two ft. aerial and selective enough to slice off the sidebands of a signal. I was thinking about him recently and thought it might be fun to get away from all the modern gadgetry and go back to basics and build such a regen for swl. I'd rather use FETs than tubes and I want the ultimate selectivity. The usual circuits I've run across don't seem capable of my goals so I'm asking for your experiences and tricks you've come up with to build your ultimate regen. Any and all suggestions appreciated. 73 all.

With all respect to your Elmer, if that were always and strictly true, why wouldn't we all be using regens?

Truth be known, the "simple" regen receiver is a lot trickier than it looks, and it seems like no two work alike, even if built with identical parts by the same person. I remember building the vacuum tube versions out of the Radio Amateurs Handbooks of the 50's, and some were hot, others were not. The FET design in the later handbooks likewise gives similar results. You just have to futz with 'em, and nobody knows exactly why. (Though there are no shortage of theories.) You hit the nail on the head though, when you said you'd like to have some fun experimenting. It IS fun. Just do it for the fun of it, and be happy with whatever performance you can get by judicious tweaking.

Paul: AFAIK, the best designs for regens (and some neat superregens)
are covered really well by Charles Kitchin of Analog Devices. I have in
front of me the fall '94 issue of Communications Quarterly, where Charles
has a 13 page article on the superregen receiver. He had an earlier article
on straight regens, but my copy of that is lost somewhere near the bottom
layer of papers in my radio room/library/aluminum tubing collection.I
believe that he had one in the last few years in QST, but my archival system
is on the fritz....hope this helps. Good luck with the project. Please keep
us on the hombrew NG posted on your progress.

I don't want to throw water on a desire to experiment and learn. But one thing you should consider is that regenerative receivers are notorious for radiating as well as receiving. What might have been tolerable in your Elmer's day might not be acceptable in today's intensely-used RF environment. You should consider including an RF stage to isolate the oscillating detector from the antenna and, if possible, measure the emissions to make sure they comply with current regulations.

We've been running "The Boy's First Receiver" project in Popular
Communications
Magazine for the past few months. Uses a single 1H4, 1G4 or type 30 or 199
triode.
Coils cover from BCB thru about 12 MHz. Set runs on three 9 volt batteries
and a D
cell(s). Regens are a lot more fun when using glow bottles!

At high regeneration levels the set acts similarly to a "Q multiplier";
advancing the
regen does give some increased selectivity, but certainly no where's near
enough
for SSB reception.

1727. Re: What is SSB and CW? How works VOX?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-06 00:00:00 UTC
From: Will White <wcw@uswest.net>
Message-ID: <37ABAC56.9CB6B0AB@uswest.net>
Source record: 68074

Nova,

SSB stands for Single Side Band. It is a method of transmitting AM, or amplitude modulated, radio signals. AM signals are made up of a carrier frequency, and two side bands. The human voice, or computer data information, is contained in both side bands. You need only one side band to receive all the information, so the carrier and other side band are removed at the transmitter, amplified, and transmitted. This is a much more efficient use of power, and that is why SSB is used, to increase signal strength at greater distances using the same amount of watts.

CW stands for continuous wave. It is the traditional way radio amateurs refer to morse code communication of the radio. It works very simply, but just turning the carrier signal on and off, forming "dihs" and "dahs".

VOX means "voice operated transmission." It is a system of keying a voice transmitter's microphone using sound energy, instead of having to manually press the transmit switch each time you wish to speak.

For more information, try the following web links:

http://www.ac6v.com
http://itre.ncsu.edu/radio/

Also, look for your local amateur radio club. They would be happy to help you understand these things.

<snip>

You could use a power transistor in series with the power
supply to the PA. This method is often used in multi-mode
CB rigs.

I am interested in doing this also. I have seen designs using a PWM (Pulse Width Modulated) system. This would use switch mode FETs and would not need a tranformer. A filter would be needed in the supply to the final to remove the PWM subcarrier (at about ?100KHz) You could use a switch mode FET for the RF amp also at 80M. Anyone done this?

If carrier power is secondary, simply modulate the class C final and driver
stage
using the 1/2 VCC output from a mono audio hifi amplifier IC as the source
of collector
voltage.

This should be trivial, just use port output pins to replace the
dipswitches.
I'm planning on doing this in the near future, but with an AVR processor
(join the dark side luke.. feel the power)

You will want to keep the micro from radiating junk into the receiver, so
series resistors will help, and proper layout around the micro, but it
should be pretty easy.

>the amount of VRef to get to "0"
>
I do want to stick with 555's rather than using an off the shelf chip, the
additional complexity does not put me off. I am looking for a practical
circuit schematic for a pulse width controller using the 555, hopefully some
system which gives an output whose pulse width is inversely proportional to
some input control voltage. I will then use an op amp to sense the output
voltage and perhaps current to control the duty cycle.
I agree, it would be simpler to use a linear regulator such as an LM317 and
pass transistors, but I don't like the idea of rows of red hot 2N3055's
wasting watts of power.

Thanks for your help and time.

1740. FARFest Sep 26 (G'burg hamfest relocated to Bowie, MD)

FOUNDATION FOR AMATEUR RADIO
c/o Al Brown
8645 TOWER DRIVE
LAUREL, MD 20723-1244

-- For immediate release --

F.A.R.FEST '99 AT NEW LOCATION

The Foundation for Amateur Radio (FAR) will sponsor the 42nd annual F.A.R.Fest amateur radio hamfest on Sunday, September 26, 1999, at Prince George's Stadium 1/4 mile south of the junction of US-50 on US-301 in Bowie, Maryland between Washington, DC and Annapolis, Maryland.

This is a new location for F.A.R.Fest, with a paved area that accommodates over 700 tailgaters. Vendors and other sellers will be able to set up under the canopy of the stadium concourse. General admission tickets into F.A.R.Fest '99 are $5.00 at the gate; $10.00 for tailgating, which requires the purchase of general admission. Vendors and other exhibitors should contact Marry Morris, N4TCI at amateur_radio@hotmail.com, or at 703-971-3905 for more information.

The Special Events station W3PRL-AM will be on display.

Talk-in frequencies are 146.520 MHz and 147.105(+) MHz.

To get to F.A.R.Fest '99:

From points North:
Take I-95 south to the Baltimore Beltway (I-695) to Exit 4 (I-97 South) toward Annapolis. On I-97 South, take Exit 7 (Route 3 South - Bowie/Odenton). Take Route 3 for approximately 11 miles. After passing under the Route 50 overpass, proceed to second traffic light and turn left into Stadium Drive. NOTE: Route 3 changes to Route 301 after you pass under Route 50.

From points South:
Take I-95 North to Exit 104 (Route 301 North). Take 301 North past Upper Marlboro. Go through the traffic light at the Route 197 intersection (Rip's Country Inn will be on the right). At the next traffic light, turn right into Stadium Drive.

From points East:
Take Route 50 West to Exit 13A (Route 301 South). At the second traffic light, turn left into Stadium Drive.

From points West:
From I-70 East, follow directions coming from points North.

From Washington, D.C. or the Capital Beltway:
From D.C., take New York Avenue to Route 50 East, or the Capital Beltway, Exit 19A (Route 50 East). Take Route 50 to Exit 11 (Route 197). Go South on Route 197 for approximately 1.5 miles to Route 301. Turn left onto Route 301 and remain in the right lane. Turn right at first traffic light into Stadium Drive.

For general information on F.A.R.Fest '99, see the webpage at URL:

http://www.amateurradio-far.org/

or contact Al Brown, KZ3AB, at &#65533;amateur_radio@hotmail.com,&#65533; or at 301-490-3188.

There's nothing like having a good memory, one that can remember articles
from years ago, but not having the magazines organized enough to easily
find the article when you need it.

I don't have the superregen article, have the regen one, and have no
idea where I've put it. But Communications Quarterly is fairly good about
printing an accumulative index from time to time, and I could find one of
those. The Fall 1994 issue had the superregen article by Charles Kitchin.
The regen article was in the Fall 1995 issue.

Communications Quarterly sells back issues. I don't have the information
handy.

Eventually, I plan to buy the issue with the superregen article
(distribution of CommQuart here in Montreal has been sporadic over the
years, though it seems to be reliable now at one place where I buy
magazines). I'm curious whether it's just a review of the design, or if
he adds to the art.

The regen article does cover the history of the design, and some
traditional circuits. But he also shows some solid-state versions that do
advance the circuit further. Someone who is interested in regenerative
receivers would do well to get the article. Over the years there have

been plenty of articles about the receiver, but there hasn't been much about the theory since the early days, with most articles being construction articles which are either a duplicate of someone elses project, or a slight variation for who knows what reasons.

Charles Kitchin also had an article in Electronics Now (or maybe it was before the name change, in which case it was Radio Electronics) similar to the one in CommQuart. I can't remember the date though, but it might be around 94 or 95.

He also had an article in QST a few years back, and I can't find that either, for a regen receiver using a crystal, for reception of W1AW.

When transistors, and then a bit later FET's, hit the hobbyist circles, there were plenty of regen receivers described in the magazines. It was a real hodge-podge, with some trying to do straight translations of tube circuits. Sometimes they said they worked fine, other times they said there were problems. Sometimes people tried to take the basic premise, and put them in terms better suited for the new devices. Some of them look intriguing, though I never tried them. Then direct conversion receivers came along, and the regen articles stopped.

I think there is still room to play with regen receivers. Not so much because the world needs a better regenerative detector, but in understanding it you learn some very basic ideas, and in trying to improve it, you have a chance for exploration.

Regens were popular when parts were expensive. Nowadays, active components are downright cheap. Is the best regen receiver as simple as possible, or can it be improved by adding devices or even stages? Do you build a really good oscillator, putting into it all you would for a good vfo? Does regulatiion help? Someobdy mentioned an RF amplifier for the sake of keeping the oscillation from reaching the antenna, but it would also isolate the antenna from the tricky regen stage.

In recent years, there have been attempts at trying these things. Charles Kitchin gives some ideas, though his are still fairly simple. There was aregen receiver in Popular Electronics in the past decade, that had an active antenna and a regulator and some other fancy schemes. Again, I don't have the date or the issue handy. There was an article in 73 a few years back that used an MC1496 in a regen receiver. the description didn't really explain it, and I finally traced out the circuit to find that it seemd more a novelty than really making use of the 1496.

There was a time when regeneration was common in receivers, in the form of the Q-mulitplier. You don't see those talked about very often, though due to a new local station, I'm tempted to try a Q-multiplier on the car radio that I use for medium wave listening, to see if it will knock down the local so I can still listen to WBZ in Boston. When the 7360 and 9MHz crystal filters were popular, one idea that made a wave for a time was a front-end Q-multiplier, to beef up a simple front-end. That too has gone out of view.

And let's not forget that at one time one scheme was a regen (or in some cases superregen) detector following a converter of some kind. A superhet, but with a regen detector. It too has potential, and it's not a lot different from the times when "direct conversion receivers" were made mulit-band by putting a converter ahead of it.

Michael VE2BVW

1743. Re: CALLING ALL REGEN GURUS

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-08 00:00:00 UTC
From: n2cqr@erols.com
Message-ID: <37ad857c.165265754@news.erols.com>
Source record: 67991

I think it is probably easier to get a superhet working right, but some of the recent articles about the regens really caught my eye. Especially the articles in the G-QRP club magazine SPRAT.

I started tinkering around yesterday with a Doug DeMaw regen circuit. Just an MPF102 FET and an op amp. I never had much luck with it before, but yesterday I decided to see if it could turn it into something useful.

Most of the circuit was built ugly style on a small perf board. I tacked the perf board, the variable caps (bandset and band spread) and the two pots onto a piece of 1/4 inch plywood. Used some of those tubular nut starters from Radio Shack as shaft extenders for the controls (to minimmize hand effect). Finally (not wanting to ruin my hearing by doing this blooper tinkering with earphones on) I attached a discarded computer speaker to the op amp output.

I had a lot of fun. My tuned circuit seemed to go from about 6 mhz up to about 13.8 Mhz. (I had a general coverage rx on the bench and would just put the detector into regeneration and tune around for the signal to determine where the regen rx was tuning). DeMaw's circuit had a 1 K pot for regeneation control. I found this made it kind of tough to find the precise "just below oscillation" point, so I put a 25 ohm pot in series -- this now serves as a regeneration fine tuning."

Radio Japan, RCI, the BBC all sound great!

At first I thought that this rx would be useful only for SWL stuff, but last night I put it on 40 CW and found that (as the SPRAT writers have been indicating) these little receivers have real communcation potential.

"RX HR MPF102 OM!" "TX 2N2222" That would certainly have them scratching their heads!

Gary --

Harsh so be it. When I buy a program I sort of expect it to run on most
plain-vanilla systems. RD requires a certain level video card, a certain level
OS, and anything else jams the system.

ARRL's answer? Oh, sure, we know about those problems. Just send it back and
we'll give you your money back. That's bullshit.

Ever try to send something back through a government bureaucracy? I just said
to hell with it, some taxpayer spent $150 for trash, and I'm honestly sorry
about that.

Nope. In this incarnation I'm either an RF circuit design engineer by day or a RF circuit design college professor by night. Neither set of systems will work with this little bozo of a program. Sorry, I don't mind trying a demo and finding the bugs. When they make you buy it with known limitations and don't publish the limitations, I get pissy.

Hello,
I want to modify a CB linear amplifier for HF bands (160 - 10 mt);
it uses 3 X EL509 (the first tube is a pre-ampl.,i think from 5-10 watts to
50-100 watt then applied to the last 2); I will use 3x EL519 instead of
EL509;
My questions are:
1) can I use the same transformer and power supply for the 3 x EL509,
this time,all in parallel ? (I think yes !);
2) The original HV schematic has a secondary 700 volt A.C.,then applied to
a full-wave bridge,giving about 1000 volt D.C.(unloaded);
in same home-made linear ampl. i saw 4x EL519 with 1410 volt D.C. in the
plate (max value) or often 1200 volt:
may I use a voltage dubler instead of full-wave bridge to have about
1400 volt (unloaded,so something less with load) ? may I use this
voltage
with the EL519 ? and the Plate current will be enough ? (i think not,
infact with a doubler we have V x 2 but at the same time I / 2 !)
3) the original schematic has a negative voltage supply for grid while I
will use grounded grid schematic (with a zener for bias:it's simple !)
what's the different between these 2 way ? (especially for the power
output ?)
4) How many watts can i expect from 3 EL519 with the voltage up specified
(1000 V dc unloaded and 6,3 V ac) ? (I think about 300 watts in the
middle band).
I hope someone will be so kind to help me;
if someone have interest in it,I can send photo and info time to time while
working on it.

Get a crimp tool and put another on. A properly done connection
of this sort is one of the MOST reliable ones you can use.

Thats precisely why you DO see them on telephones.

Your elmer is right,

The 6SN7GT tube or the 12SNGT tube
or the 12AU7 tube is the best bet, it even works
well at 12-24 volts on the plate.
I built a regen using this tube and it is very-very good,
Please use a choke load (primary of a small 110v-6 volt transformer)
for the first detector, and a throttle cap to control the regen , use a
22Meg+22pf grid leak, and lightly couple the antenna and you are all set.

Low voltage tube circuit at 12-24 volts is a lot of fun , inexpensive
and more sensitive than a corresponding circuit using FETs.

If you want a circuit, I can provide it,
another place to look for a discussion of regens is the
ThePorch GLowbugs newsgroup archives.

have lots of fun.

1400 VOLTS on EL519,

MAY GOD BLESS those EL519s

why cant you just stick with 1000 volts on plate,
even that will be found to be excessive with the current tube quality.

If you really want 1400 volts on plate
, please use the 4x150 or other equivalents
that are available cheap surplus.

I hooked MC3356 to first IF (after ssb filter) of my FT-902, had to
disable AGC from RF amp (only RF-gain control). Measured 70dB range
(over 1uV), and so far no signal has peaked the meter. Couldn't use
lower threshold because of some unwanted spurious signal to the log
detector. Using the transceiver for measuring purposes, the RF gain
adds some 35dB decrease of signal level. IF stages has AGC as original

Believe I scanned the circuit to gif file if somebody is interested
It is important to use a gain-adjustable input stage (40673) and some
DC level shifting stage, but I did not find a good fast attack and
slow decay meter circuit for MC3356P. It has only LARGE time constant

Hello all...

Given a model number and telephone number is it possible to track down a pager using any sort of detection method? We have a kidnapped young lady in the area and one fact in the case is that she probably has her pager with her. The suspect is behind bars, but she has been missing for 10 weeks now.

The official Motorola response was 'impossible' but I'm wondering if it's more like 'very difficult so next to impossible.' I don't know the pager protocols... is there a transmitter in the thing or just a receiver? I Don't have a pager, so don't even know if 10 weeks is well beyond expected battery life.

Any help in answering the question would be appreciated.

More like almost impossiable. The battery life is not that long in
most pagers. The pager probably does have a local oscillator that
you can probably hear at a few feet to maybe 50 feet at a wild guess
for the range. All you have go to do is get that close.

Monty,

I probably should let Jim speak for himself, but I believe his point is that he bought it using government money. I can understand this because I bought both a personal copy, with my money, and a copy for work using company money.

If I was to try and send back the company copy, the cost of the paperwork would exceed the $150 cost of the program.

Jim and I differ on the usefulness of the program, but agree on the lousy support.

I think UKW Berichte (VHF Communications) had some circuits for this, by Wolfgang Scheider DJ8ES, back in 1995 or so. I'll have a look this week for 'em.

On a slightly different note, surely if he is the 'Chairman of the Hertford ARS' then he should be able to deisgn a resonable transverter. Just use an SBL1, 94MHz xtal oscillator, FET preamp and some filtering and PIN diode switching, with MMICs for low power TX amplification (make sure some good filters are used in-between stages).

I was thinking of the same question. Are any kits of components made/ are there any 'clean' PCB layouts avail. on the net. I think AD is bringing out a pin-compatible chip with 300MHz clk (max), which would be cool.

I think that you have to watch out for aliases, and use the highest possible clock rate. If you look at the data sheet then the 2nd order components Fclk-Fout might be troublesome, as Fclk max is only 125MHz. I was thinking of using this chip as a VFO for a D-C, image rejecting transceiver (with ADSP21xx backend).

I would expect phase noise to be constant, or nearly so over the entire freq. range. As mentioned above, spurs may come closer to the wanted signal as the freq. is increased.

Henry OM,

Analog Devices will be introducing a new DDS chip, the AD9854. It has
300 MHz clock, 24x internal PLL multiplier (allows 15 MHz crystal), and
has both I and Q DDS generators, with 0.1% max phase error. It also has
programmable rise and fall time keying (excellent for CW!), and
single-pin FSK input (with programmable freq change rate rise and fall
times). This chip should make an excellent DDS LO source for a DC
phasing receiver, useful up to perhaps 100 MHz or so. It also has
12-bit DACs, with 80 dB SFDR. It is in an SMT package only. Do a
search on analog devices' web site for more info.
See http://products.analog.com/products/info.asp?product=AD9854

You'll need a crimp tool that will handle 8 conductor RJ-45 plugs. These are the same ones used on Ethernet patch cords and ISDN modems. The Radio Shack crimp tool will only do 4 conductor RJ-11 plugs (unless they've changed it recently).

We've had MUCH better luck with the modular plugs than we ever did with the round ones, though you'd never believe it by looking at one.

Good luck,

A few years ago I saw an article that discussed using a DDS chip around
50 MHz.
What the author did was, rather than low pass filtering to eliminate
aliases,
he bandpass filtered to get the 50 MHz alias he did want. The circuit
he
had used a 40 MHz clock. The only problem I could see with the idea was
you would have to watch out for any other spurs that might fall within
the
passband of the bandpass filter. Also, you have reduced power output
compared
to operation below the clock frequency.

1777. Homebrew Transverter for 33CM thoughts?

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-09 00:00:00 UTC
From: Joe Leikhim <jleikhim@nettally.com>
Message-ID: <37AF9232.AEF6F71E@nettally.com>
Source record: 68025

I am considering building a homebrew transverter for 33CM as I have access to some commercial parts in and around that range. What would be the consequences of using a low IF (28 MHz or 27 MHz, Radio Shack SSB)? I am concerned about images from cellular and SMR bands. Would a high side or low side injection be best? I would prefer low side to keep the SSB polarity matching that of the rig.

Hi,

Did anyone reading this digest buy one of these
Transistor, diode scr, etc testers from Radio Shack?

Very handy unit when it works.
With fresh hot Duracell batteries,
my tester has stopped working, gives totally wrong answers.
Allows me to instal 2N2222 parts with reversed Emitter and Collector
leads.

My owners manual is lost in my shop.
Can someone please read manual and tell me how long is the warranty?

I no longer can receive the HAM_Homebrew Digest via email.
Sorry, I cannot see your replies that way.

PLEASE replies to me DIRECTLY as well as group.
Please hurry, my warranty, if 90 days, is running out.

Thanks for any help, 73, W6MIK

Don't forget the series R. Adding caps alone to the control lines just
means more hi freq noise when they transition! The R would go close to the
uP.

I've also got a package of code that will get you started easily. Let me
know if you want it.

I'll outline my experiences with a similar setup and hopefully it'll be
of some help. I ran a DownEastMicrowave transverter using an HR-2510
for the IF, low side injection, with a 25 watt amplifier chain. My
application wasn't SSB, but was for a remote base input and I was using
the setup mobile in Southern California. The biggest problem I ran into
was receiver desense from all of the many very strong signals from the
commercial transmitters both above and below the 900 Mhz band. I was
using the low part of the 33cm band, in the 902.x Mhz region. I think
the pagers in the 928-930 Mhz region were the worst offenders though the
cellular band was bad too. Assuming you're in a major metropolitan
area, the only way to combat this is to put some big-time filtering on
the front end of the receiver, which in my case meant bandpass cavities.
This also takes care of any image problems that may come up, and I had
some of those too. Don't worry about a couple of Db loss through a the
cavities because once you get rid of the garbage, you can always add a
GasFet preamp to make up for some of the loss. When you're in a crowded
RF environment, I'll take a higher noise figure with better filtering
any day of the week. Now if you're out in the sticks its a different
story....

Hello--

If you don't need a highly linear sawtooth waveform, you can use
either a neon lamp or a unijunction to build a minimum-component-count
oscillator. Try searching on these topics, or locate an older edition
of a GE transistor manual.

A higher 1st IF would be better. Since the band is 26 MHz wide,
it will be nearly impossible to avoid either the cellular band (on the
low side) or the pager band (just above 928) ...

> I am concerned about images from cellular and SMR bands. Would a
high
> side or low side injection be best? I would prefer low side to keep
the
> SSB polarity matching that of the rig.

If you have to use a 10m or 11m radio as an IF, you'd probably
be better with low side injection. The power levels from the cellular
base stations are generally not as high as the 900 MHz pagers just
above the top of the 902-928 band . Some of them are running a LOT of
power.
The cellular folks only run what they need to cover the cell so that
they can maximize frequency reuse. The pager folks really blast
it out, seeking to maximize coverage and in-building penetration.

Again, however, (for best performance) a higher "IF" would be
better. A 2m all-mode rig would be reasonable, for example, since
you could get good image rejection with low loss ceramic coaxial
filters with the image ~292 MHz below. Your main concern then
would be to get a good system noise figure without overloading
the 2m rig's front end and creating intermod problems for yourself.
You may even find that the best solution would be to have say,
12-16 dB of good low noise, high IP3 gain in the receive LNA,
followed by a 2nd image filter, followed by an attenuator to
prevent overload of the 2m rig. (You'll need to know the noise
figure and IP3 of the "IF" radio to do the cascade calculations
for noise figure and IP3 to make those decisions.)

A higher IF will also help you adequately suppress images on
transmit ... the cellular and pager folks would not appreciate
interference on "their" channels ... they can be very protective

if they're getting clobbered.

Good luck & 73,

Sorry, but once you have those "couple of dB" of loss in front of
your low-noise amp, there is NO way to "make it up" ... if you
have a LNA with a 2 dB noise figure (easy to get at 900 MHz,
even better is possible with GaAs FETs) and you add 2 dB of
loss in front of it (feedline, filters, whatever) you have AT BEST
a 4 dB system noise figure. NO amount of gain will make it
better, ever.

The solution is to have as little passive loss as possible before
your LNA.

As far as desense and intermod are concerned, you have to have
adequate dynamic range (IP3) through the entire cascade, at least
until your main selectivity kicks in and rejects all but the desired
signal, otherwise you're screwed in that department, too. Once
the signals have seen the non-linearity and mixed, no amount of
filtering can eliminate the (now on-channel) intermod products.

Another thing to watch for is "reciprocal mixing." If your LO
has poor phase noise performance, strong signals nearby
(where "nearby" can be quite a few MHz if the phase noise
"skirts" on your LO are bad) will pick up the phase noise
from your noisy LO and (even though the strong carrier is "far
away:) the phase noise extending out from those "blockers"
(and raised up to xx dB below the blocker at some offset) can be
potent enough to "mask" weak desired signals in that noise,
reducing the effective sensitivity of your receiver.

Personally, I prefer the lowest possible noise figure and the
highest possible IP3, no matter where I am :-)

1794. WTB 1\Mitrex 19pin plug

Newsgroup: rec.radio.amateur.homebrew
Date: 1999-08-10 00:00:00 UTC
From: "Dennis A. Homerick" <w8nw@richnet.net>

Thanks for reading this message. I'm in the process of making a uhf repeater using two
Mitrex radios. Need a couple 19 pin control head plugs. Don't need the control heads.

Thanks
Dennis, w8nw

1795. Re: saw tooth oscillator circuit wanted

I don't think this would work with a zener. It requires a
negative-resistance region in the active device. In a neon bulb, this
results from the fact that the turn-on voltage is greater than the
extinguishing voltage, and the oscillation occurs between these points.
Actually, I think some zeners may have a very small negative-resistance
region, because of the ability of some to generate very wideband noise
at some current levels. But if it is a stable region and you tried to
make use of it, you'd at best have an oscillation amplitude at the
microvolt level. A tunnel diode would work, but again at a very low
amplitude level. And they're hard to come by these days.
